### **Chapter 1: Overview**

### 1.1 INTRODUCTION TO THE 2020 RACT DEMONSTRATION

The San Joaquin Valley (Valley) is an intermountain basin comprised of nearly 25,000 square miles. The Valley's geography and meteorology exacerbate the formation and retention of high levels of air pollution. Surrounding mountains and consistently stagnant weather patterns prevent the dispersal of pollutants that accumulate within the Valley. The region is also home to the state's major arteries for goods and people movement, thereby attracting a large volume of vehicular traffic. Additionally, the Valley's large biogenic emissions, wildfires, and pollution transported from outside the boundaries of the San Joaquin Valley Air Pollution Control District (District) contribute significantly towards the Valley's current air quality challenges.

To achieve the District's mission of improving air quality and public health for all Valley residents, the District has developed and implemented numerous air quality plans to reduce emissions from stationary sources through the adoption of nearly 650 of the most stringent rules in the nation. In addition to regulatory efforts, the District has strong voluntary incentive programs that have invested more than \$2.8 billion of combined funds in clean-air projects. Similarly, the California Air Resources Board (CARB) has adopted regulations and incentive measures for mobile sources. Together, these efforts represent the nation's toughest air pollution emissions controls and have greatly contributed to reduced ozone concentrations in the Valley. Over the past several decades, these air quality improvement efforts have reduced oxides of nitrogen (NOx) emissions (primary precursor for both ozone and PM2.5) from mobile and stationary sources by over 75%, including a greater than 90% reduction from stationary sources under the District's jurisdiction, resulting in significant air quality progress towards meeting the health-based federal ozone and PM2.5 standards. These efforts resulted in the Valley being the first and only region in the nation with an "extreme" nonattainment classification to subsequently attain the federal 1-hour ozone standard.

Despite substantial progress made to improve air quality in the Valley through the implementation of existing plans and clean air investments by Valley businesses and residents, the Valley continues to experience unique and significant air quality challenges in attaining the increasingly stringent federal air quality standards. On October 1, 2015, the U.S Environmental Protection Agency (EPA) strengthened the National Ambient Air Quality Standards (NAAQS, or standards) for ground-level ozone, lowering the primary and secondary ozone standard levels to 70 parts per billion (ppb). The Valley is classified as an "extreme" nonattainment area for the 2015 ozone standard. This nonattainment classification sets forth a requirement to adopt a Reasonably Available Control Technology (RACT) demonstration as a revision to the State Implementation Plan (SIP) no later than August 3, 2020.

Pursuant to Sections 182(b)(2) and (f) of the federal Clean Air Act (CAA, or "the Act"), areas classified as moderate or above for ozone nonattainment are required to implement RACT requirements for sources that are subject to EPA Control Techniques

Guidelines (CTGs) and for "major sources" of volatile organic compounds (VOCs) and NOx, which are ozone precursors. These RACT requirements ensure that significant sources of emissions in nonattainment areas are controlled to a "reasonable" extent, but not necessarily to the more stringent control levels expected of new or modified major stationary sources.

District staff have previously prepared comprehensive RACT demonstrations, through which EPA has approved current District rules as meeting RACT. Most recently, in 2018, EPA fully approved the 2014 Reasonably Available Control Technology (RACT) Demonstration for the 2008 8-Hour Ozone State Implementation Plan (SIP) (2014 RACT SIP), which demonstrated that the District's current rules implemented RACT for all CTG categories and all major, non-CTG sources.1 This 2020 Reasonably Available Control Technology Demonstration for the 2015 8-Hour Ozone Standard (2020 RACT Demonstration) will build upon the analyses conducted for previous RACT demonstrations, as well as control measure analyses conducted for the recent 2018 Plan for the 1997, 2006, and 2012 PM.2 Standards (2018 PM2.5 Plan). The 2018 PM2.5 Plan demonstrated that District rules for both NOx and PM2.5 implemented the Most Stringent Measures feasible for implementation in the region. It is important to note that, due to the nonattainment classification of the Valley, and due to the comprehensive rule evaluations regularly conducted as a part of planning for attainment of both PM2.5 and ozone health-based air quality standards. District rules exceed RACT.

The preparation of the 2020 RACT Demonstration included a comprehensive evaluation of all NOx and VOC District rules to ensure that each rule meets or exceeds RACT. District staff carefully reviewed and compared each rule to federal, state, and local regulations, and reviewed resources such as state suggested control measures and technology clearinghouses, to determine that existing major sources and CTG sources in the Valley are subject to RACT. This 2020 RACT Demonstration fulfills CAA requirements and demonstrates that all federal RACT requirements continue to be satisfied in the Valley. The below sections of Chapter 1 outline the requirements for a RACT demonstration, review available EPA guidance, and further discuss the District's process for preparing this SIP revision.

### 1.2 2015 8-HOUR OZONE RACT DEMONSTRATION ELEMENTS

EPA's Final Rule for Implementation of the 2015 8-Hour Ozone NAAQS establishes guidance for air districts to demonstrate that RACT levels of emission controls are being

<sup>&</sup>lt;sup>1</sup> 83 FR 41006 - EPA Rulemaking for the California State Implementation Plan: San Joaquin Valley Unified Air Pollution Control District 2014 Reasonably Available Control Technology (RACT) Demonstration for the 8-Hour Ozone State Implementation Plan (SIP), available at: <a href="https://www.govinfo.gov/content/pkg/FR-2018-08-17/pdf/2018-17714.pdf">https://www.govinfo.gov/content/pkg/FR-2018-08-17/pdf/2018-17714.pdf</a>

implemented.<sup>2</sup> Much of the approach from the SIP demonstration elements under the 2008 Ozone SIP Requirements Rule (80 FR 12265, March 6, 2015) are retained for the 2015 Ozone NAAQS.

Additionally, a letter from EPA Region IX in 2006, provides further clarification by discussing EPA Region IX's understanding of what might constitute an acceptable RACT SIP submittal.<sup>3</sup> The strategy outlined in the letter includes the following main points:

- A description of efforts to identify all source categories within the District requiring RACT, including CTG sources (i.e., covered by an EPA Control Technique Guideline document) and major non-CTG sources.
- A submission of negative declarations where there are no facilities (major or minor) within the District subject to a CTG.
- A list of the state/local regulation that implements RACT for all categories needing RACT, including the date EPA approved these regulations as fulfilling RACT.
- A description of the basis for concluding that the regulations fulfill RACT. Documents useful in establishing RACT include CTGs, Alternative Control Technique guidelines (ACT), Maximum Achievable Control Technology (MACT) standards, New Source Performance Standards (NSPS), California Suggested Control Measures (SCM) and RACT/Best Available Retrofit Control Technology (BARCT) determinations, regulations adopted in other Districts, and guidance and rules developed by other state and local agencies.

Pursuant to EPA's guidance, this RACT Demonstration is composed of several main elements:

- A demonstration that EPA CTGs are being implemented in the Valley, and a discussion and recertification of the negative declarations for categories that do not exist in the Valley. (See Chapter 2)
- A demonstration that all major NOx and VOC sources in the Valley are covered by RACT rules. (See Chapter 3)
- A demonstration that the District's rules for ozone precursors (NOx and VOC) satisfy RACT levels of stringency, applicability, and enforceability. (See Chapter 4)

### 1.3 PROCESS FOR DEVELOPING THIS RACT DEMONSTRATION

### 1.3.1 Review of Federal RACT Requirements

CAA Section 182(b)(2) states that ozone attainment plans shall assure that RACT for VOCs is applied at certain sources:

"The State shall submit a revision to the applicable implementation plan to include provisions to require the implementation of reasonably available control technology under section 172(c)(1) of this title with respect to each of the following:

- (A) Each category of VOC sources in the area covered by a CTG document issued by the Administrator between November 15, 1990, and the date of attainment.
- (B) All VOC sources in the area covered by any CTG issued before November 15, 1990.
- (C) All other major stationary sources of VOCs that are located in the area."

Section 182(f) extends federal RACT requirements to NOx rules and major NOx sources. Because the San Joaquin Valley Air Basin is classified as an "extreme" ozone nonattainment area, "major sources" are defined as sources that generate more than 10 tons per year of NOx or VOC.

### **Definition of RACT**

Although the Clean Air Act itself does not define Reasonably Available Control Technology, 40 CFR 51.100(o) defines RACT as:

"devices, systems, process modifications, or other apparatus or techniques that are reasonably available, taking into account (1) the necessity of imposing such controls in order to attain and maintain a national ambient air quality standard; (2) the social, environmental, and economic impact of such controls; and (3) alternative means of providing for attainment and maintenance of such a standard."

The foregoing definition applies to a specific federal provision regarding approval of extension requests for attainment plans for secondary air quality standards, but in the absence of a more definitive regulatory description, it is concise and useful. EPA also defined RACT in the Strelow memorandum<sup>4</sup> as:

<sup>&</sup>lt;sup>4</sup> The Strelow RACT Memorandum, published in BNA Environmental Reporter, December 9, 1976, pages 1210-1212

"the lowest emission limitation that a particular source is capable of meeting by the application of control technology that is reasonably available, considering technological and economic feasibility".

### Purpose of Federal RACT

The CAA requires RACT for certain sources in all nonattainment areas nationwide, regardless of the severity of the ozone problem.

"172(c) Nonattainment plan provisions
The plan provisions (including plan items) required to be submitted under this part shall comply with each of the following:

### (1) In general

Such plan provisions shall provide for the implementation of all reasonably available control measures as expeditiously as practicable (including such reductions in emissions from existing sources in the area as may be obtained through the adoption, at a minimum, of reasonably available control technology) and shall provide for attainment of the national primary ambient air quality standards."

From this section, it is clear that RACT is intended as the minimum level of control that all ozone nonattainment areas must achieve for existing sources. It is also clear that RACT is not intended as the only level of control needed for all nonattainment areas to attain the ozone standard. Two key conclusions are drawn from the section above: first, states must adopt RACT for existing sources regardless if they are needed for attainment, and second, states may need additional measures beyond RACT to attain the standard. This second conclusion leads to the understanding that RACT is not intended to be the most stringent level of control in an area's attainment strategy.

In the greater context of air pollution control levels, RACT is understood as the "floor-level" of air pollution controls, not the "ceiling-level." Examples of more effective levels of emissions control include Best Available Control Technology (BACT) and Lowest Achievable Emission Rate (LAER). BACT and LAER are required for new sources, and for existing sources undergoing modification. Under state and federal air pollution programs, new facilities face more stringent pollution control requirements than existing facilities, with the understanding that better controls can be more easily implemented before a facility is built, than after it is built. New sources must generally implement BACT<sup>5</sup> and existing sources must implement a less stringent level of control such as

<sup>&</sup>lt;sup>5</sup> Federal regulations for permitting new facilities require Best Available Control Technology (BACT) for new sources in attainment areas, and Lowest Achievable Emission Rate (LAER) – a generally more stringent level –for new sources in nonattainment areas. LAER differs from BACT in that economic costs are **not** considered for candidate LAER controls that are considered "Achieved in Practice." Under California state law, the District is required to apply

Reasonably Available Control Technology (RACT). Additionally, California law establishes an intermediate level of control that is the "best available" for "retrofit" to existing sources (entitled Best Available Retrofit Control Technology – BARCT<sup>6</sup>), recognizing that the state's worst ozone problems demands more effective pollution control than what is usually considered "reasonably available." It should also be noted that since District rules fulfill BARCT requirements for state purposes, and the control technology established by a BARCT rule is by definition the most effective retrofit control for the source category; it can be assumed to, at a minimum, satisfy RACT requirements, if not exceed RACT.

As discussed above, the purposes of BACT, RACT, and BARCT are different. BACT is designed to minimize the growth in future stationary source emissions with the installation of best available controls; RACT is designed to reduce current stationary source emissions from existing sources with the application of reasonably available controls; and BARCT is designed to reduce current stationary source emissions even further with the application of best available retrofit controls. BACT is identified and prescribed in the permitting process on a case-by-case administrative basis. RACT and BARCT are developed on an industry-wide basis in the rule development process, which concludes with regulatory action by the District Governing Board.

This understanding that RACT is intended to serve as the minimum level of control is further clarified with respect to the evaluation of cost-effectiveness (\$/ton of emissions reduced) for potential emission reduction options. EPA discusses a cost threshold for NOx in the Final Rule to implement the 8-hour Ozone National Ambient Air Quality Standard [70 FR 71611, pg. 71654]. A range of \$160–1,300 per ton of NOx removed was considered RACT in 1994. Adjusting for inflation, the RACT cost effectiveness threshold established by EPA is estimated to be \$2,300 per ton of NOx removed. Other estimates for the appropriate RACT cost-effectiveness level have ranged up to \$5,000 per ton of NOx or VOC removed. These RACT cost-effectiveness levels are significantly more cost-effective than BACM, BARCT, BACT, LAER, and other more stringent measures that are generally \$10,000 per ton of NOx or VOC emissions reduced, and sometimes up to hundreds of thousands of dollars per ton of NOx or VOC emissions reduced.

### 1.3.2 RACT Demonstration Process

The preparation of this report involved careful and wide-ranging examination of individual rules against recent EPA RACT actions, federal regulations, state regulations, and technology guidelines, as well as evaluating District rules against comparable rules from California's most technologically progressive air districts. The process began by

1-6

<sup>&</sup>quot;BACT" for new sources under essentially the same requirements as federal LAER. The District's "BACT" determinations thus fulfill the federal LAER requirements.

<sup>&</sup>lt;sup>6</sup> California Health and Safety Code (CH&SC) 40406: ... "best available retrofit control technology" means an emission limitation that is based on the maximum degree of reduction achievable, taking into account environmental, energy, and economic impacts by each class or category of source.

comparing District rules to EPA's CTGs. There are a total of 43 EPA CTGs. Chapter 2 of this report links the EPA-promulgated CTGs with the District rules that cover the same source category.

The next part of the process was to identify the major sources of NOx and VOCs in the Valley. For this demonstration, District staff began with the federal CAA definition of major source. In the CAA, what constitutes a major source depends on the nonattainment classification of the area where the source is located. The District's classification as "extreme" for the 2015 8-hour ozone standard sets a major source threshold for NOx or VOC that has a potential to emit of at least 10 tons per year. The connection between the Valley's major sources and applicable District rules is outlined in Chapter 3 of this report. The District's database of current Permits-to-Operate was queried to find those sources that have the potential to emit at least 10 tons per year of either NOx or VOC. Chapter 3 contains a list of all of the facilities that have the potential to emit of at least 10 tons per year of either NOx or VOC, and the NOx and VOC rules to which the facility's equipment is subject.

Finally, Chapter 4 contains RACT evaluations of current District rules. All of the District's NOx and VOC prohibitory rules are addressed in this RACT demonstration. The rules were rigorously compared to federal and state regulations and state and federal guidance on emission controls. As previously agreed to by EPA staff, the rules were also compared to analogous regulations adopted by California's most technologically progressive air districts: South Coast Air Quality Management District, Bay Area Air Quality Management District, Sacramento Metropolitan Air Quality Management District, and Ventura County Air Pollution Control District. Where other agencies had taken recent regulatory action requiring control technology that was potentially more stringent than that required by current District rules, District staff evaluated the new requirements for possible implications to previous RACT findings.

Based on the foregoing, District staff finds that all District rules that apply to ozone precursor emissions fulfill RACT requirements for the 2015 8-hour Ozone NAAQS. At a minimum, District rules meet RACT or, more commonly, significantly exceed RACT. Moreover, District staff finds that all CTG sources and major non-CTG sources under its jurisdiction are controlled to RACT or better standards.

In addition to the analyses conducted for this RACT demonstration, the District has begun preliminary analyses and research for the attainment plan for the 2015 8-hour ozone standard, which will be due to EPA no later than August 3, 2022. As part of this attainment plan, the District will reevaluate the control measures analyzed in this 2020 RACT Demonstration, in addition to several other District regulations. While this demonstration is targeted at ensuring that the District's regulations meet RACT levels of emission control, the attainment plan will also examine other emission reduction opportunities that exceed RACT standards.

### 1.3.3 Public Process

To ensure that the public has had the opportunity for meaningful participation in the development of the upcoming planning efforts, District staff provided multiple opportunities for the public to learn more about air quality and to provide the District with comments or to request more information. The District presented updates on planning efforts for attainment of the 2015 8-hour federal ozone air quality standard at a public hearing on February 20, 2020. The District hosted a public workshop to discuss the implementation requirements of the 2015 ozone standard, including the RACT SIP, on March 17, 2020. Additionally, District staff has presented regular updates regarding the development of this RACT demonstration at public meetings, including the District Governing Board, Citizens Advisory Committee (CAC), and the Environmental Justice Advisory Group (EJAG).

To ensure additional public participation, the results of the comprehensive analysis became available for public review on May 19, 2020. Public comments will be accepted and incorporated into the analysis as appropriate. The District's Governing Board will consider this report at a public hearing to be held on June 18, 2020.

The report will be subsequently transmitted to CARB, who will then submit the report to EPA by the August 3, 2020, deadline specified in the Implementation Rule.

### **Chapter 2: CTG Source Categories and Applicable District Rules**

### 2.1 DISTRICT IMPLEMENTATION OF EPA CONTROL TECHNIQUES GUIDELINES

The federal Clean Air Act (CAA) requires areas designated nonattainment for ozone and classified moderate and above to implement Reasonably Available Control Technology (RACT). More specifically, CAA section 182(b)(2) and 182(f) requires the adoption of RACT level requirements for source categories covered by EPA Control Techniques Guidelines (CTG), or if a source category does not exist in the affected area, the District may submit a Negative Declaration.

### 2.2 CTG SOURCES

There are a total of 43 EPA CTGs. For this demonstration, District staff reviewed District rules for matching CTG source categories, and then compared the rule requirements to the CTG recommendations. A demonstration that District rules implement CTGs is included as part of Chapter 4.

Table 2-1 shows the CTGs promulgated by the EPA to date, and the corresponding District rules.

Control Techniques Guidelines for the Oil and Natural Gas Industry	VOC	EPA-453/B-16-001	2016/10	Rules 4623, 4624, 4401, 4402, 4407, 4408, 4409, in combination with the requirements of California's Greenhouse Gas Emissions Standards for Crude Oil and Natural Gas Facilities <sup>7</sup>

<sup>&</sup>lt;sup>7</sup> On October 25, 2018, CARB submitted California's Greenhouse Gas Emission Standards for Crude Oil and Natural Gas Facilities into the California SIP. The CARB SIP submittal states that this regulation, in combination with District rules, meets or exceeds RACT. <a href="https://ww2.arb.ca.gov/resources/documents/submittal-oil-and-gas-reg-ca-sip">https://ww2.arb.ca.gov/resources/documents/submittal-oil-and-gas-reg-ca-sip</a>

### 2.3 CTGS WITHOUT SUBJECT FACILITIES IN THE VALLEY

If there are no facilities within the District's boundaries that are subject to a particular CTG, the District Governing Board has two options. The first option is to create and implement a RACT rule for the CTG source category, even though there would be no source subject to the rule. The second option requires the District's Governing Board to approve a negative declaration, as a signed Governing Board resolution, stating that there are no major sources and no minor sources that would be subject to a given CTG.

As required by the implementation rule for the 2015 8-Hour Ozone NAAQS, District staff reviewed all EPA CTGs and applicable facilities in the Valley. Based on the District's extensive review of permit files and other sources, the District determined that there are no sources in the Valley subject to the following CTGs:

Table	2-2: Negative D	Declarati	ons

Tabl	e 2-2: Negative [	Declarati	ons
Description	EPA Report	Date	Previous Negative Declaration Document
Industry			
Reactor Processes and Distillation Operations in Synthetic Organic Chemical Manufacturing Industry	EPA-450/4-91-031	1993/08	Revised SIP (6/21/18)
Control Techniques Guidelines for Shipbuilding and Ship Repair Operations (Surface Coating)	61 FR-44050	1996/08	<ul> <li>2006 RACT/SIP (8/17/06)</li> <li>2009 RACT/SIP (4/16/09)</li> <li>2014 RACT/SIP (6/19/14)</li> <li>Revised SIP (6/21/18)</li> </ul>

The District Governing Board has previously adopted negative declarations for these source categories as a part of the implementation requirements for the 2008 Ozone NAAQS. District staff is recommending that the Governing Board re-affirm the previous negative declarations for these source categories with another signed resolution.

## CH 3 Major Sources & Applicable RACT Rules

San Joaquin Valley Air Polluti 2020 RACT Demonstration for	on Control District the 2015 Ozone Standard	June 18, 2020
	This page intentionally blank.	

### **Chapter 3: Major Sources and Applicable RACT Rules**

### 3.1 MAJOR SOURCE LISTING

As discussed in Chapter 1, the District is required to evaluate the rules that apply to major sources. This list was developed through querying the District's database of current Permits to Operate to identify the facilities that have the potential to emit at least ten tons per year of either NOx or VOC. The individual facilities are listed in Table 3-1, along with the NOx and VOC rules that apply to the facility's equipment.

Table 3-1 includes the following information for each facility:

- Region: identifies which Valley region (Central, South, or North)<sup>13</sup> each facility is located in. This column is denoted by "C" for the Central region, "S" for the Southern region, or "N" for the Northern region.
- ID #: the District's facility identification number for each permitted source
- Facility Name: the full name of each facility
- <u>Facility Description</u>: what type of operations or processes occur at each facility to generate emissions
- Rule Numbers: the remaining columns are denoted with an "X" to identify each District NOx prohibitory rule that applies to that specific facility

Chapter 3: Major Sources and Applicable RACT Rules

<sup>&</sup>lt;sup>13</sup> Central region includes Fresno, Kings, and Madera counties; Southern region includes Kern and Tulare counties; and the Northern region includes Merced, San Joaquin, and Stanislaus counties.

This page intentionally blank.

### CH 4 Rule Analysis

San Joaquin Valley Air Pollution Control District 2020 RACT Demonstration for the 2015 Ozone Standard	June 18, 2020
This page intentionally blank.	

### **Chapter 4: Rule Analysis**

### 4.1 DISTRICT RULES ANALYZED FOR RACT

The bulk of the District's effort in preparing the 2020 RACT Demonstration was to review the District's numerous NOx and VOC regulations for compliance with federal RACT requirements. Except for the rules shown in Table 4-3, District staff reviewed the applicability, stringency, and enforceability of every District NOx or VOC prohibitory rule.

As further discussed in Chapter 1, criteria for determining that RACT is satisfied includes RACT guidance from EPA, requirements per California law, and a comparison against multiple federal regulations, state regulations, and technology guidelines, as well as evaluating District rules against comparable rules from California's most technologically progressive air districts. District staff, upon application of this criteria, was then able to determine RACT status for each rule.

EPA staff conducted a comprehensive review of District rules as a part of the preparation of their 2018 approval of the District's 2014 RACT SIP, finding that the District's rules fully satisfy RACT requirements across all applicable categories. <sup>14</sup> For this demonstration, District staff conducted additional rigorous evaluation for each of the District's rules. For District rules where no applicable federal, state, or local regulations had been amended since the publication of EPA's approval of the 2014 RACT SIP, District staff certify that these rules continue to meet RACT. These rules are listed in Table 4-1. For rules where EPA, the state, or other agencies have taken recent regulatory action that could have resulted in changes to RACT for the applicable source category, District staff have included a detailed rule evaluation to demonstrate that RACT levels of control continue to be implemented by the District rule. These rules are listed in Table 4-2, and the rule evaluations are included in the following section of this Chapter.

Chapter 4: Rule Analysis

<sup>\*</sup>Date of EPA Federal Register Notice of final approval adding rule to SIP
\*\*On August 17, 2018, EPA published a Final Rule approving the District's RACT demonstration for the 2008 federal ozone standard, which included a demonstration that the rules listed in this table met RACT [83 FR 41006].

## **RULE EVALUATIONS**

# 4.2 RULE 4306 (BOILERS, STEAM GENERATORS, AND PROCESS HEATERS – PHASE 3)

#### **District Rule 4306 Description**

District Rule 4306 was adopted September 18, 2003, and was most recently amended October 16, 2008. The purpose of Rule 4306 is to limit NOx and CO emissions from boilers, steam generators, and process heaters. The rule applies to any gaseous fuel or liquid fuel fired boiler, steam generator, and process heater with a rated heat input of 5.0 million Btu/hr or greater. This source category includes a wide range of industries including but not limited to medical facilities, educational institutions, office buildings, prisons, military facilities, hotels and industrial industries. The rule establishes NOx and CO emission limits depending on the class and category for boilers, steam generators, and process heaters.

As a complementary rule to Rule 4306, Rule 4320 goes beyond RACT requirements. EPA approved Rule 4320 as a SIP-strengthening rule after they approved Rule 4306 as meeting RACT requirements.

How does District Rule 4306 compare with federal and state rules and regulations?

#### **Federal Regulations**

There are no EPA Control Techniques Guidelines or Maximum Achievable Control Technologies applicable to this source category.

### A. EPA Alternative Control Techniques (ACT)

District staff conducted a comprehensive evaluation of EPA ACT requirements. The following ACTs have not been updated since Rule 4306 was approved as meeting RACT requirements through EPA's approval of the 2014 RACT SIP. During this approval, it was determined that this rule met or exceeded RACT. Therefore, further evaluation is not necessary at this time.

 Alternative Control Techniques Document – NOx Emissions from Industrial/Commercial/Institutional Boilers (EPA-453/R-94-022 1994/03)

#### B. New Source Performance Standards (NSPS)

District staff conducted a comprehensive evaluation of EPA NSPS requirements. The following NSPSs have not been updated since Rule 4306 was approved as meeting RACT requirements through EPA's approval of the 2014 RACT SIP. During this approval, it was determined that this rule met or exceeded RACT. Therefore, further evaluation is not necessary at this time.

- 40 CFR 60 Subpart D Standards of Performance for Fossil-Fuel Fired Steam Generators (2007/06)
- 40 CFR 60 Subpart Dc Standards of Performance for Small Industrial-Commercial-Institutional Steam Generating Units (2012/04)

#### C. National Emission Standards for Hazardous Air Pollutants (NESHAP)

District staff conducted a comprehensive evaluation of NESHAP requirements. The following NESHAPs have not been updated since Rule 4306 was approved as meeting RACT requirements through EPA's approval of the 2014 RACT SIP. During this approval, it was determined that this rule met or exceeded RACT. Therefore, further evaluation is not necessary at this time.

• 40 CFR 63 Subpart DDDDD - NESHAP for Industrial, Commercial, and Institutional Boilers and Process Heaters (2015/11)

#### **State Regulations**

There are no state regulations that apply to this source category.

#### How does District Rule 4306 compare to rules in other air districts?

District staff compared emission limits, optional control requirements, and work practices in District Rule 4306 to comparable requirements in rules from the following nonattainment areas:

- Bay Area AQMD Regulation 9, Rule 7 (Amended May 4, 2011)
- Bay Area AQMD Regulation 9, Rule 10 (Amended October 16, 2013)
- Bay Area AQMD Regulation 9, Rule 11 (Amended May 17, 2000)
- Sacramento Metropolitan AQMD Rule 411 (Amended August 23, 2007)
- Ventura County APCD Rule 74.15 (Amended November 8, 1994)
- South Coast AQMD Rule 1146 (Amended December 7, 2018)
- South Coast AQMD Rule 1109 (Amended August 5, 1988)

Based on a review of rule requirements implemented prior to EPA's approval of the 2014 RACT SIP, District staff found that Rule 4306 continues to implement RACT levels of control. For more recently amended rules, District staff is providing an analysis to demonstrate that RACT continues to be met. This analysis is presented below.

#### South Coast AQMD

 SCAQMD Rule 1146 (Emissions of Oxides of Nitrogen from Industrial, Institutional, and Commercial Boilers, Steam Generators, and Process Heaters)

	SJVAPCD 4306/4320	SCAQMD 1146
Applicability	Any gaseous fuel or liquid fuel fired boiler, steam generator, or process heater with a total rated heat input greater than 5 million Btu per hour.	Boilers, steam generators, and process heaters of equal to or greater than 5 million Btu per hour rated heat input

	SJVAPCD 4306/4320	SCAQMD 1146
Exemptions	Units regulated by other District rules such as solid fuel fired units, dryers, glass melting furnaces, kilns, and smelters.  Any units while burning any fuel other than PUC quality natural gas that: Burns non-PUC gas no more than 168 cumulative hours in a calendar year plus 48 hours per calendar year for equipment testing; NOx emission do not exceed 150 ppm.	capacity used in industrial, institutional, and commercial operations.*  (1) Boilers used by electric utilities to generate electricity; and (2) Boilers and process heaters with a rated heat input capacity greater than 40 million Btu per hour that are used in petroleum refineries; and (3) Sulfur plant reaction boilers. (4) RECLAIM facilities (NOx emissions only)
Requirements Category A	9 ppm standard	Non-RECLAIM
Units 5-20 MMBtu/hr Except Categories C through G units	6 ppm enhanced	7 ppm for fire tube units 9 ppm for all other units  RECLAIM 9 ppm for fire tube units 12 ppm for all other units
Category B Units > 20 MMBtu/hr Except Categories C through G units	7 ppm standard 5 ppm enhanced	20-75 MMBtu/hr Non-RECLAIM 7 ppm for fire tube units 9 ppm for all other units RECLAIM 9 ppm for fire tube units 12 ppm for all other units 75 MMBtu/hr or greater Non-RECLAIM 5 ppm RECLAIM 9 ppm
Category C.1 Oilfield Steam Generators 5-20 MMBtu/hr	9 ppm standard 6 ppm enhanced	
Category C.2 Oilfield Steam Generators >20 MMBtu/hr	7 ppm standard 5 ppm enhanced	SCAQMD Rule 1146 applies to Industrial, Institutional, and Commercial Units. Oilfield steam generators do not fall into either one of these categories per
Category C.3 Oilfield Steam Generators fired on less than 50% PUC quality gas	9 ppm	definitions in the rule.
Category D.1 Refinery Units 5-20 MMBtu/hr	9 ppm standard 6 ppm enhanced	SCAQMD Rule 1146 applies to Industrial,
Category D.2 Refinery Units 20-110 MMBtu/hr	6 ppm standard 5 ppm enhanced	Institutional, and Commercial Units. Petroleum Refineries do not fall into either one of these categories per definitions in
Category D.3 Refinery Units >110 MMBtu/hr	5 ppm	the rule.

SJVAPCD 4306/4320	SCAQMD 1146
9 ppm	
9 ppm	For units using 9.0 billion Btu/yr or less, tune up twice a year. For units over that limit, units must meet the following applicable limit: 25 ppm landfill gas units, 15 ppm digester gas units, otherwise, for other units: 20-75 MMBtu/hr Non-RECLAIM 7 ppm for fire tube units 9 ppm for all other units RECLAIM 9 ppm for all other units 12 ppm for all other units 75 MMBtu/hr or greater Non-RECLAIM 5 ppm RECLAIM 9 ppm
9 ppm	15 ppm for digester gas fired units
9 ppm	Non-RECLAIM 7 ppm for fire tube units 9 ppm for all other units  RECLAIM 9 ppm for fire tube units 12 ppm for all other units
Category A 9 ppm standard 6 ppm enhanced  Category B 7 ppm standard	12 ppm NOx (natural gas)
Category A 9 ppm standard 6 ppm enhanced  Category B 7 ppm standard 5 ppm enhanced  Category A	15 ppm NOx 25 ppm NOx
	9 ppm  7 ppm standard fopm enhanced  Category A for ppm standard for ppm enhanced  Category A for ppm standard for ppm enhanced  Category A for ppm standard for ppm enhanced  Category B for ppm standard for ppm enhanced

	SJVAPCD 4306/4320	SCAQMD 1146
District Rule 4306 does not	6 ppm enhanced	
limits specifically for units		
fired with landfill gas.	Category B	
Therefore, these units	7 ppm standard	
would be subject to the	5 ppm enhanced	
limits in Category A or B.		
Other units fired on	5 ppm to 9 ppm (as shown in the above	30 ppm NOx
gaseous fuel	categories)	
This is a general category		
in SCAQMD's rule that is		
covered under multiple		
categories in Rule 4306		

Comparison of these rules revealed that the NOx limits in recently amended SCAQMD Rule 1146 are potentially more stringent for several unit categories in District Rule 4306, while in other categories, District Rule 4306 is more stringent. SCAQMD Rule 1146 only applies to units at industrial, institutional, and commercial operations, whereas District Rule 4306 applies to any gaseous fuel or liquid fuel fired boilers, steam generators, or process heaters with a total rated heat input > 5 MMBtu/hr. In adopting Rule 1146, SCAQMD estimated a cost-effectiveness range of \$20,000 to \$30,000 per ton of NOx emissions reduced, significantly higher than accepted RACT cost-effectiveness levels.

RACT is intended as the minimum level of control that all ozone nonattainment areas must achieve for existing sources. RACT is not intended as the only level of control needed for all nonattainment areas to attain the ozone standard. RACT is also not intended to be the most stringent level of control in an area's attainment strategy. Given the District's existing stringent limits, the cost-effectiveness associated with the installation of additional controls will be far in excess of RACT cost-effectiveness levels.

#### Conclusion

District Rule 4306 meets or exceeds federal RACT requirements for this source category based upon evaluation of applicable federal regulations, state standards, and other air districts' rules.

# 4.3 RULE 4307 (BOILERS, STEAM GENERATORS, AND PROCESS HEATERS – 2.0 MMBTU/HR TO 5.0 MMBTU/HR)

#### **District Rule 4307 Description**

Rule 4307 was adopted on December 15, 2005, and was most recently amended April 21, 2016. The purpose of Rule 4307 is to limit NOx and CO emissions from boilers, steam generators, and process heaters. The rule applies to any gaseous fuel or liquid fuel fired boiler, steam generator, and process heater with a rated heat input of 2.0 MMBtu/hr up to and including 5.0 MMBtu/hr. This source category includes a wide range of industries including but not limited to medical facilities, educational institutions, office buildings, prisons, military facilities, hotels and industrial facilities.

#### How does District Rule 4307 compare with federal and state rules and regulations?

#### **Federal Regulations**

There are no EPA Control Techniques Guidelines, New Source Performance Standards, or Maximum Achievable Control Technologies applicable to this source category.

#### A. EPA - Alternative Control Techniques (ACT)

ACTs address potential emission control techniques for units with the potential to emit more than 25 tons of NOx per year. No units covered by District Rule 4307 have the potential to emit 25 tons per year and therefore ACTs are not directly applicable to this source category. However, ACTs do discuss various control technologies, and so the District has examined them. The following ACTs have not been updated since Rule 4307 was approved as meeting RACT requirements through EPA's approval of the 2014 RACT SIP. During this approval, it was determined that this rule met or exceeded RACT. Therefore, further evaluation is not necessary at this time.

- Alternative Control Techniques Document NOx Emissions from Process Heaters (EPA-453/R-93-034 1993/09)
- Alternative Control Techniques Document NOx Emissions from Industrial/Commercial/ Institutional Boilers (EPA-453/R-94-022 1994/03)
- Alternative Control Techniques Document-NOx Emissions from Utility Boilers (EPA-453/R-94-023 1994/03)

#### B. National Emission Standards for Hazardous Air Pollutants (NESHAPs)

District staff conducted a comprehensive evaluation of NESHAP requirements. The following NESHAPs have not been updated since Rule 4307 was approved as meeting RACT requirements through EPA's approval of the 2014 RACT SIP. During this

approval, it was determined that this rule met or exceeded RACT. Therefore, further evaluation is not necessary at this time.

 40 CFR 63 Subpart DDDDD - NESHAP for Major Sources: Industrial, Commercial, and Institutional Boilers and Process Heaters (2015/11)

#### **State Regulations**

There are no state regulations that apply to this source category.

#### How does District Rule 4307 compare to rules in other air districts?

District staff compared emission limits, optional control requirements, and work practices in District Rule 4307 to comparable requirements in rules from the following nonattainment areas:

- Bay Area AQMD Regulation 9, Rule 7 (Amended May 4, 2011)
- Bay Area AQMD Regulation 9, Rule 10 (Amended October 16, 2013)
- Sacramento Metropolitan AQMD Rule 411 (Amended August 23, 2007)
- Ventura County APCD Rule 74.15.1 (Amended June 23, 2015)
- South Coast AQMD Rule 1146.1 (Amended December 7, 2018)
- South Coast AQMD Rule 1146.2 (Amended December 7, 2018)

Based on a review of rule requirements implemented prior to EPA's approval of the 2014 RACT SIP, District staff found that Rule 4307 continues to implement RACT levels of control. For more recently amended rules, District staff is providing an analysis to demonstrate that RACT continues to be met. This analysis is presented below.

#### South Coast AQMD

 SCAQMD Rule 1146.1 (Emissions of Oxides of Nitrogen from Small Industrial, Institutional, and Commercial Boilers, Steam Generators, and Process Heaters)

	SJVAPCD Rule 4307	SCAQMD Rule 1146.1
Applicability	Rule applies to any gaseous fuel or liquid fuel fired boilers, steam generators and process heaters rated ≥2.0 MMBtu/hr to ≤5.0 MMBtu/hr	Rule applies to boilers, steam generator and process heaters >2 MMBtu/hr to <5 MMBtu/hr
Exemptions	<ul> <li>Solid fuel fired units</li> <li>Dryers and glass melting furnaces</li> <li>Kilns, humidifiers, and smelters where the products of combustion come into direct contact with the material to be heated</li> <li>Unfired or fired waste heat recovery boilers that are used to recover or augment heat from the exhaust of combustion turbines or internal combustion engines</li> <li>Burning other fuel during PUC quality natural gas curtailment as long as other</li> </ul>	Units at a RECLAIM or former RECLAIM facility subject to a NOx limit in a different rule     Units at municipal sanitation service facility subject to a NOx emission limit in Reg XI adopted or amended after 12/7/18

fuel not be burned for more than 168 hour/year plus 48 hour/year for equipment testing and NOx emissions shall not exceed 150 ppm v or 0.215 lb/MMBtu  Existing units limited to 1.8 billion Btu/yr Install & maintain non-resettable fuel flow meter; AND Tune-in the unit twice per calendar year, OR Operate and maintain the stack O2 concentrations at 3% by vol. or less, OR Operate and maintain the stack O2 concentrations at 3% by vol. or less, OR Operate and maintain the stack O2 concentrations at 3% by vol. or less for any 15-consecutive-minute averaging period, OR Operate and maintain the stack O2 concentrations at 3% by vol. or less for any 15-consecutive-minute averaging period, OR Operate and maintain stack O2 concentrations at 3% by vol. or less for any 15-consecutive-minute averaging period, OR Operate and maintain stack O2 concentrations at 3% by vol. or less for any 15-consecutive-minute averaging period, OR Operate and maintain the stack O2 concentrations at 3% by vol. or less for any 15-consecutive-minute averaging period, OR Operate and maintain the stack O2 concentrations at 3% by vol. or less for any 15-consecutive-minute averaging period, OR Operate and maintain the stack O2 concentrations at 3% by vol. or less for any 15-consecutive-minute averaging period, OR Operate and maintain the stack O2 concentrations at 3% by vol. or less for any 15-consecutive-minute averaging period, OR Operate and maintain the stack O2 concentrations at 3% by vol. or less for any 15-consecutive-minute averaging period, OR Operate and maintain the stack O2 concentrations at 3% by vol. or less for any 15-consecutive-minute averaging period, OR Operate and maintain stack O2 concentrations at 3% by vol. or less for any 15-consecutive-minute averaging period, OR Operate and maintain the stack O2 concentration prior to 100 at 100		SJVAPCD Rule 4307	SCAQMD Rule 1146.1

"Units with \$12 ppmv NOX installed, modified, or issued permits prior to 12/7716, at a non-RECLAM facility will become subject to the 7 ppm NOX initis burner are replaced, or for more of units burner are replaced, or formed units burner are replaced. The formed of the proper NOX inclined or issued permits prior to 12/7716, at a non-RECLAM facility will become subject to the 7 ppm NOX inhichever is earlier.  "Units with \$30 ppmv NOX inmit when 50% or more of units burner are replaced, or formed units burner are replaced. The formed permits prior to 12/7716, at a non-RECLAM facility will become subject to the 12 ppm NOX inmit when 50% or more of units burner are replaced. The formed permits prior to 12/7716, at a non-RECLAM facility will become subject to the 12 ppm NOX inmit when 50% or more o		hour/year plus 48 hour/year for equipment testing and NOx emissions shall not exceed 150 ppmv or 0.215 lb/MMBtu	
	Requirements	<ul> <li>Install &amp; maintain non-resettable fuel flow meter; AND</li> <li>Tune-in the unit twice per calendar year, OR</li> <li>Operate and maintain the stack O<sub>2</sub> concentrations at 3% by vol. or less, OR</li> <li>Certify unit to comply with 30 ppmv NOx and 400 ppmv CO (gaseous fuel) when annual limit is exceeded; if unit is replaced then comply with limits of New and Replacement units (see below).</li> <li>Existing atmospheric units in oilfield or refinery; each glycol reboiler; or each unit with heat input &gt; 1.8 to &lt; 5 billion Btu/yr:</li> <li>30 ppmv NOx (gaseous fuel)</li> <li>40 ppmv NOx (liquid fuel-fired units)</li> <li>New and Replacement units:</li> <li>12 ppmv NOx (atmospheric units)</li> </ul>	RECLAIM facilities, or in operation prior to December 7, 2019 at RECLAIM or former RECLAIM) limited to ≤1.8 billion Btu/yr  Operate and maintain stack O₂ concentrations at 3% by vol. or less for any 15-consecutive-minute averaging period, OR  Tune-in the unit twice per year (4 to 8 months apart)  All other units (not mentioned below)  30 ppmv NOx or for natural gas-fired units 0.036 lb-NOx/MMBtu New and replacement units:  7 ppmv NOx for any fire-tube boilers on natural gas**  9 ppmv NOx for natural gas fired units excluding fire-tube boilers, atmospheric units, and thermal fluid heaters***  12 ppmv NOx for natural gas-fired atmospheric units  12 ppmv NOx for natural gas-fired thermal fluid heaters****  15 ppmv NOx for digester gas fired units  Weight average limit for multi-fuel units (e.g., units using both natural gas and digester gas, etc.);  **Units with ≤12 ppmv NOx, >9 ppmv NOx, and ≤ 9 ppmv NOx installed, modified, or issued permits prior to 12/7/18, at a non-RECLAIM facility will become subject to the 7 ppm NOx limit when 50% or more of unit's burner are replaced, or by December 7, 2033, whichever is earlier.  ***Units with ≤12 ppmv NOx and >9 ppmv NOx installed, modified or issued permits prior to 9/5/08, at a non-RECLAIM facility will become subject to the 9 ppmv NOx limit when 50% or more of unit's burner are replaced, or by December 7, 2033, whichever is earlier.  **Units with ≤30 ppmv NOx installed, modified, or issued permits prior to 12/7/18, at a non-RECLAIM facility will become subject to

<sup>\*</sup>Unless otherwise stated, all ppmv values are on a dry basis and corrected to 3% stack oxygen by volume.

District Rule 4307 is at least as stringent as SCAQMD Rule 1146.1 because it contains comparable NOx limits for similarly rated units. Rule 4307 also has lower NOx emission limits for units fired on fuels other than natural gas. Therefore, District Rule 4307 is as stringent as or more stringent than SCAQMD Rule 1146.1.

#### South Coast AQMD

 SCAQMD Rule 1146.2 (Emissions of Oxides of Nitrogen from Large Water Heaters and Small Boilers and Process Heaters)

	SJVAPCD Rule 4307	SCAQMD Rule 1146.2
Applicability		
Applicability	Rule applies to any gaseous fuel or liquid fuel fired boilers, steam generators and process	Applicable to natural gas-fired water heaters, boilers and process heaters with rated heat
	heaters rated ≥2.0 MMBtu/hr to ≤5.0 MMBtu/hr	input capacity of ≤2 MMBtu/hr
Exemptions	Solid fuel fired units	Units used in recreational vehicles.
	<ul> <li>Dryers and glass melting furnaces</li> </ul>	Units subject to SCAQMD Rule 1121 (control
	Kilns, humidifiers, and smelters where the	of nitrogen oxides from residential type,
	products of combustion come into direct contact with the material to be heated	natural gas-fired water heaters) – Rule 1121 applies to units rated at <0.075 MMBtu/hr
	Unfired or fired waste heat recovery boilers	Units at a RECLAIM or former RECLAIM
	that are used to recover or augment heat	facility subject to a NOx limit in a different rule
	from the exhaust of combustion turbines or	Units at municipal sanitation service facility
	internal combustion engines	subject to a NOx emission limit in Reg XI
	Burning other fuel during PUC quality natural gas curtailment as long as other fuel	adopted or amended after 12/7/18  The provision of paragraph (c)(3), (c)(4) and
	not be burned for more than 168 hour/year	(c)(5) shall not apply to:
	plus 48 hour/year for equipment testing and	Any residential unit*
	NOx emissions shall not exceed 150 ppmv	Units with >0.4 & ≤2 MMBtu/hr, demonstrated
	or 0.215 lb/MMBtu	to use less than 9,000 therms during every
Barrier Inc.	E : (	calendar year

	<ul><li>heat input &gt; 1.8 to &lt; 5 billion Btu/yr:</li><li>30 ppmv NOx (gaseous fuel)</li></ul>	
	40 ppmv NOx (liquid fuel-fired units)	
	New and Replacement units:	
	12 ppmv NOx (atmospheric units)	
	9 ppmv NOx (non-atmospheric units)	

<sup>\*</sup>Unless otherwise stated, all ppmv values are on a dry basis and corrected to 3% stack oxygen by volume.

District Rule 4307 is more stringent than SCAQMD Rule 1146.2 because it contains more stringent NOx limits for similarly rated units and applies to a wider range of fuel types.

#### Conclusion

District Rule 4307 meets or exceeds federal RACT requirements for this source category based upon evaluation of applicable federal regulations, state standards, and other air districts' rules.

# 4.4 RULE 4308 (BOILERS, STEAM GENERATORS, AND PROCESSS HEATERS - 0.075 MMBTU/HR TO LESS THAN 2.0 MMBTU/HR)

#### **District Rule 4308 Description**

The purpose of this rule is to limit NOx and CO emissions from units within this source category. As a point of sale rule, Rule 4308 achieves emissions reductions as units subject to the rule are replaced over time. This point-of-sale approach allows the District to achieve NOx emission reductions without forcing immediate replacement of existing units to comply with rule requirements and thus placing an undo financial burden on the consumer. This rule has resulted in more than 93% control of emissions from this source category.

Rule 4308 was adopted on October 20, 2005 to establish NOx emissions limits for units that were previously exempt from District regulations because of their small size. The rule was amended in December 2009 to lower the NOx emissions limits to 20 ppmv for units fired on natural gas, with the exception of instantaneous water heaters and pool heaters greater than or equal to 0.075 MMBtu/hr but less than or equal to 0.4 MMBtu/hr. In 2013, the rule was amended to lower the NOx emission limit for instantaneous water heaters 0.075 MMBtu/hr to 0.4 MMBtu/hr to 20 ppmv. EPA published a direct final approval of the 2013 amendments to Rule 4308 on February 12, 2015.

How does District Rule 4308 compare with federal and state rules and regulations?

## **Federal Regulations**

There are no EPA Control Techniques Guidelines, New Source Performance Standards, National Emission Standards for Hazardous Air Pollutants, or Maximum Achievable Control Technologies applicable to boilers, steam generators, and process heaters with a rated heat input capacity greater than or equal to 0.075 Million Btu/hr and up to but not including 2.0 Million Btu/hr.

#### A. EPA - Alternative Control Techniques (ACT)

ACTs address potential emission control techniques for units with the potential to emit more than 25 tons of NOx per year. No units subject to District Rule 4308 have the potential to emit 25 tons per year; therefore, ACTs are not directly applicable to this source category. However, ACTs do discuss various control technologies, and so the District has examined them. The following ACTs have not been updated since Rule 4308 was approved as meeting RACT requirements through EPA's approval of the 2014 RACT SIP. During this approval, it was determined that this rule met or exceeded RACT. Therefore, further evaluation is not necessary at this time.

 Alternative Control Techniques Document - NOx Emissions from Process Heaters) (EPA-453/R-93-034 1993/09)

- Alternative Control Techniques Document NOx Emissions from Industrial/Commercial/ Institutional Boilers (EPA-453/R-94-022 1994/03)
- Alternative Control Techniques Document NOx Emissions from Utility Boilers (EPA-453/R-94-023 1994/06)

#### **State Regulations**

There are no state regulations that apply to this source category.

#### How does District Rule 4308 compare to rules in other air districts?

District staff compared the emission limits, optional control requirements, and work practices in District Rule 4308 to comparable requirements in rules from the following nonattainment areas:

- Bay Area AQMD Regulation 9, Rule 6 (Amended November 7, 2007)
- Bay Area AQMD Regulation 9, Rule 7 (Amended May 4, 2011)
- Bay Area AQMD Regulation 9, Rule 10 (Amended October 16, 2013)
- Sacramento Metropolitan AQMD Rule 411 (Amended August 23, 2007)
- Sacramento Metropolitan AQMD Rule 414 (Amended October 25, 2018)
- Ventura County APCD Rule 74.11.1 (Amended September 11, 2012)
- Ventura County APCD Rule 74.15.1 (Amended June 23, 2015)
- South Coast AQMD Rule 1146.2 (Amended December 7, 2018)

Based on a review of rule requirements implemented prior to EPA's approval of the 2014 RACT SIP, District staff found that Rule 4308 continues to implement RACT levels of control. For more recently amended rules, District staff is providing an analysis to demonstrate that RACT continues to be met. This analysis is presented below.

#### Sacramento Metropolitan AQMD

 SMAQMD Rule 414 (Water Heaters, Boilers and Process Heaters Rated Less than 1 MMBtu/hr)

	SJVAPCD Rule 4308	SMAQMD Rule 414
Applicability	Applicable to boilers, steam generators and process heaters with rated heat input capacity of ≥0.075 MMBtu/hr and <2 MMBtu/hr	Applicable to boilers, steam generators, and process heaters fired on gaseous or non-gaseous fuels with a rated capacity of <1 MMBtu/hr
Exemptions	<ul> <li>Units installed in manufactured homes.</li> <li>Units installed in recreational vehicles.</li> <li>Hot water pressure washers.</li> </ul>	<ul> <li>Water heaters in recreational vehicles</li> <li>Pool/spa heater with a heat input rate</li> <li>&lt;0.075 MMBtu/hr.</li> <li>Water heaters, boilers and process heater fired on LPG fuel.</li> </ul>
Requirements	Units ≥0.075 to ≤0.4 MMBtu/hr (except, instantaneous water heater and pool heaters below):     PUC gas - 20 ppmv (0.024 lb/MMBtu);     Non-PUC or liquid – 77 ppmv (0.093 lb/MMBtu)	Units <0.075 MMBtu/hr:  • 40 ng/J of heat output or 55 ppm NOx for mobile home units  • 10 ng/J of heat output or 15 ppm NOx for all other units

SJVAPCD Rule 4308	SMAQMD Rule 414
2) Units >0.4 to <2.0 MMBtu/hr (except, instantaneous water heater and pool heaters below):  • PUC gas – 20 ppmv (0.024 lb/MMBtu)  • Non-PUC or liquid – 30 ppmv (0.036 lb/MMBtu)	Units ≥ 0.075 to <0.4 MMBtu/hr:  • 40 ng/J of heat output or 55 ppm NOx for pool/spa units  • 14 ng/J of heat output or 20 ppm NOx for all other units
3) Instantaneous water heaters ≥0.075 to ≤0.4  MMBtu/hr:  • PUC gas – 20 ppmv (0.024 lb/MMBtu)  • Non-PUC or liquid – 77 ppmv (0.093 lb/MMBtu)	Units ≥ 0.4 to <1 MMBtu/hr:  • 14 ng/J of heat output or 20 ppm NOx
<ul> <li>Instantaneous water heaters &gt;0.4 to &lt;2.0 MMBtu/hr:</li> <li>PUC gas – 20 ppmv (0.024 lb/MMBtu)</li> <li>Non-PUC or liquid – 77 ppmv (0.093 lb/MMBtu)</li> </ul>	
<ul> <li>5) Pool heaters ≥0.075 to ≤0.4 MMBtu/hr:</li> <li>• PUC gas – 55 ppmv (0.068 lb/MMBtu)</li> <li>• Non-PUC or liquid – 77 ppmv (0.093 lb/MMBtu)</li> </ul>	
<ul> <li>Pool heaters &gt;0.4 to &lt;2.0 MMBtu/hr:</li> <li>PUC gas - 20 ppmv (0.068 lb/MMBtu)</li> <li>Non-PUC or liquid - 30 ppmv (0.036 lb/MMBtu)</li> </ul>	

For the majority of the categories, District Rule 4308 is as stringent as or more stringent than SMAQMD Rule 414.

#### South Coast AQMD

 SCAQMD Rule 1146.2 (Emissions of Oxides of Nitrogen from Large Water Heaters and Small Boilers and Process Heaters)

	SJVAPCD Rule 4308	SCAQMD 1146.2
Applicability	Applicable to boilers, steam generators and process heaters with rated heat input capacity of ≥0.075 MMBtu/hr and <2 MMBtu/hr	Applicable to <u>natural gas-fired</u> water heaters, boilers and process heaters with rated heat input capacity of ≤2 MMBtu/hr
Exemptions	Units installed in manufactured homes.     Units installed in recreational vehicles.     Hot water pressure washers.	<ul> <li>Units used in recreational vehicles.</li> <li>Units subject to SCAQMD Rule 1121 (control of nitrogen oxides from residential type, natural gas-fired water heaters) – Rule 1121 applies to units rated at &lt;0.075 MMBtu/hr</li> <li>Units at a RECLAIM or former RECLAIM facility subject to a NOx limit in a different rule</li> <li>Units at municipal sanitation service facility subject to a NOx emission limit in Reg XI adopted or amended after 12/7/18</li> <li>The provision of paragraph (c)(3), (c)(4) and (c)(5) shall not apply to:         <ul> <li>Any residential unit*</li> <li>Units with &gt;0.4 &amp; ≤2 MMBtu/hr, demonstrated to use less than 9,000 therms during every calendar year</li> </ul> </li> </ul>

	SJVAPCD Rule 4308	SCAQMD 1146.2
Requirements	1) Units ≥0.075 to ≤0.4 MMBtu/hr (except, instantaneous water heater and pool heaters below):  • PUC gas - 20 ppmv NOx (0.024 lb/MMBtu);  • Non-PUC or liquid – 77 ppmv NOx (0.093 lb/MMBtu)  2) Units >0.4 to <2.0 MMBtu/hr (except, instantaneous water heater and pool heaters below):  • PUC gas – 20 ppmv NOx (0.024 lb/MMBtu)  • Non-PUC or liquid – 30 ppmv (0.036 lb/MMBtu)  3) Instantaneous water heaters ≥0.075 to ≤0.4 MMBtu/hr:  • PUC gas – 20 ppmv (0.024 lb/MMBtu)  • Non-PUC or liquid – 77 ppmv (0.093 lb/MMBtu)  4) Instantaneous water heaters >0.4 to <2.0 MMBtu/hr:  • PUC gas – 20 ppmv (0.024 lb/MMBtu)  • Non-PUC or liquid – 77 ppmv (0.093 lb/MMBtu)  • Non-PUC or liquid – 77 ppmv (0.093 lb/MMBtu)  • Non-PUC or liquid – 77 ppmv (0.093 lb/MMBtu)  • Non-PUC or liquid – 77 ppmv (0.093 lb/MMBtu)  • Non-PUC or liquid – 77 ppmv (0.093 lb/MMBtu)  • Non-PUC or liquid – 77 ppmv (0.093 lb/MMBtu)	Units >0.4 to ≤2 MMBtu/hr:  • 14 ng-NOx/J of heat output or 20 ppmv NOx (or less)  Units (excluding pool heaters) ≤0.4 MMBtu/hr:  • 14 ng-NOx/J of heat output or 20 ppmv NOx (or less)

\*Unless otherwise stated, all ppmv values in the table are ppmv @ 3% O2

The District evaluated the requirements contained within SCAQMD Rule 1146.2, and found no requirements to be more stringent than those already in District Rule 4308.

#### Conclusion

District Rule 4308 meets or exceeds federal RACT requirements for this source category based upon evaluation of applicable federal regulations, state standards, and other air districts' rules.

## 4.5 RULE 4309 (DRYERS, DEHYRDATORS, AND OVENS)

#### **District Rule 4309 Description**

Rule 4309 (Dryers, Dehydrators, and Ovens) was adopted on December 15, 2005 to limit NOx and CO emissions from dryers, dehydrators, or ovens fired on gaseous, liquid, or gaseous and liquid fuel sequentially that have a total rated heat input for the unit of 5.0 MMBtu/hr. The rule limits NOx emissions to between 3.5-12 ppmvd for four categories of equipment. The adoption of Rule 4309 has considerably reduced NOx emissions to ultra-low levels.

#### How does District Rule 4309 compare with federal and state rules and regulations?

### **Federal Regulations**

There are no EPA Control Techniques Guidelines, New Source Performance Standards, National Emission Standards for Hazardous Air Pollutants, or Maximum Achievable Control Technologies applicable to this source category.

#### A. Alternative Control Techniques (ACT)

District staff conducted a comprehensive evaluation of EPA ACT requirements. The following ACTs have not been updated since Rule 4309 was approved as meeting RACT requirements through EPA's approval of the 2014 RACT SIP. During this approval, it was determined that this rule met or exceeded RACT. Therefore, further evaluation is not necessary at this time.

• Alternative Control Techniques Document - NOx Emissions from Cement Manufacturing (EPA-453/R-94-004 1994/03)

#### **State Regulations**

There are no state regulations applicable to this source category.

#### How does District Rule 4309 compare to rules in other air districts?

District staff compared emission limits, optional control requirements, and work practices in District Rule 4309 to comparable requirements in rules from the following nonattainment areas:

- Sacramento Metropolitan AQMD Rule 419 (Amended October 25, 2018)
- Ventura County APCD Rule 74.34 (Adopted December 13, 2016)
- South Coast AQMD Rule 1147 (Amended July 7, 2017)

Bay Area AQMD does not have an analogous rule for this source category. Based on a review of rule requirements implemented prior to EPA's approval of the 2014 RACT SIP, District staff found that Rule 4309 continues to implement RACT levels of control. For the more recently amended rule, District staff is providing an analysis to demonstrate that RACT continues to be met. This analysis is presented below.

#### Sacramento Metropolitan AQMD

Sacramento AQMD Rule 419 (NOx from Miscellaneous Combustion Units)

Cacramente / to	· ·	die 419 (NOX NOM Wiscellaneous Combustion Onits)		
	SJVAPCD Rule 4309	PCD Rule 4309 SMAQMD Rule 419		
Applicability	Rule applies to dryer, dehydrator, or oven that is fired on gaseous fuel, liquid fuel, or is fired on gaseous and liquid fuel sequentially, and the total rated heat input for the unit is 5.0 MMBtu/hr or greater.	This rule applies to any miscellaneous combustion units and cooking units with a total rated heat input capacity of 2 million Btu per hour or greater located at a major stationary source of NOx and to any miscellaneous combustion unit or cooking unit with a total rated heat input capacity of 5 million Btu per hour or greater that is not located at a major stationary source of NOx.		
Exemptions	. •			
Rule 4309 Exemption Categories:	Sections of the Rule			
Column-type or tower dryers used to dry grains, or tree nuts.	Section 4.1.1			
Units to pre-condition onions or garlic prior to dehydration	Section 4.1.2			
Charbroilers	Section 4.1.5			
Units used to dry lint cotton or cotton at cotton gins	Section 4.1.6	No such exemption stated in the rule.		
Smokehouses or units used for roasting	Section 4.1.3			
Units to bake or fry food for human consumption	Section 4.1.4			
Requirements				
Rule 4309 Equipment Categories:				
	No process temperature		Process Temperature	9
Gaseous Fuel-Fired Equipment			< 1200° F	≥ 1200° F
Dehydrators	-	Oven, Dehydrator, Dryer, Heater, Kiln, or Other Furnace	30 ppmvd @ 3% O2% (3.3 ppmvd @ 19% O2) or 0.036 lb/MMBtu	60 ppmvd (6.5 ppmvd @ 19% O2) or 0.073 lb/MMBtu
Asphalt/Concrete Plants	4.3 ppmvd @ 19% O2 (equates to 0.0492 lb/MMBtu)	Asphalt Manufacturing Operation	O2)	40 ppmvd @ 3% O2 (4.3 ppmvd @ 19% O2)
Milk, Cheese and Dairy Processing (<20 MMBtu/hr)	3.5 ppmvd @ 19% O2 (equates to 0.04 lb/MMBtu)		For units located at a major stationary source of NOx	For units located at a major stationary source of NOx
Milk, Cheese and Dairy Processing (≥20 MMBtu/hr)	5.3 ppmvd @ 19% O2 (equates to 0.061 lb/MMBtu)		30 ppmvd (equates to 3.3 ppmvd @ 19% O2)	60 ppmvd (equates to 6.5

	SJVAPCD Rule 4309	SMAQMD Rule 419		
			or 0.036 lb/MMBtu	ppmvd @ 19% O2) or 0.073 lb/MMBtu
		Incinerator or Crematory Metal Heat Treating or Metal Melting Furnace Other	60 ppn (6.5 ppmvd @ 19% O2 60 ppn (6.5 ppmvd @ or 0.073 lb.	or 0.073 lb/MMBtu nvd 2 19% O2) /MMBtu 60 ppmvd
		Furnace	3.3 ppmvd @ 19% O2) or 0.036 lb/MMBtu	(6.5 ppmvd @ 19% O2) or 0.073 lb/MMBtu
Other processes not described above	4.3 ppmvd @ 19% O2 equates to 0.0492 lb/MMBtu	Soybean Roaster	45 ppmvd ( 4.95 ppmvd @ 19% O2) or 0.055 lb/MMBtu	60 ppmvd (6.5 ppmvd @ 19% O2) or 0.073 lb/MMBtu
		Other Units Not Listed Above	30 ppmvd (3.3 ppmvd @ 19% O2) or 0.036 lb/MMBtu	60 ppmvd (6.5 ppmvd @ 19% O2) or 0.073 lb/MMBtu
		Cooking Unit	<500° F  40 ppmvd (4.3 ppmvd @ 19% O2) or 0.053 lb/MMBtu	≥ 500 ° F 60 ppmvd (6.5 ppmvd @ 19% O2) or 0.073 Ib/MMBtu
Liquid Fuel-Fired Equipment				
All Liquid Fuel-Fired Units	Varies from 3.5 ppmvd @ 19% O2 to		For units located at a major stationary source of NOx 40 ppmvd (equates to	For units located at a major stationary source of NOx
	12 ppmvd @ 19% O2		4.3 ppmvd @ 19% O2) or 0.053 lb/MMBtu	(equates to 6.5 ppmvd @ 19% O2) or 0.073 lb/MMBtu

SMAQMD Rule 419 establishes emission limits based on the process temperature and does not consider the equipment categories, whereas District Rule 4309 does not consider the process temperature and instead establishes emissions limits based on the equipment categories. Under SMAQMD's Rule 419, the NOx limits vary from 3.3 to 6.5 ppmv at 19% O2 with an average of 4.9 ppmv, while District Rule 4309 limits NOx emissions from 3.5 to 5.3 ppmv with most categories limited to 4.3 ppmv at 19% O2, independent of the process temperature. Overall, District Rule 4309 is at least as stringent, if not more stringent than SMAQMD Rule 419.

#### Conclusion

District Rule 4309 meets or exceeds federal RACT requirements for this source category based upon evaluation of applicable federal regulations, state standards, and other air districts' rules.

## 4.6 RULE 4311 (FLARES)

#### **District Rule 4311 Description**

District Rule 4311, amended on June 18, 2009, addresses any operation involving the use of a flare for VOC control. This source category currently includes flares associated with oil and gas production, methane and VOC gases extracted from landfills, municipal sewage treatment, wastewater treatment at food production facilities, petroleum refining, and VOC control of blowing agents at plastics product manufacturing. Flaring is a high temperature oxidation process used to burn combustible components, mostly hydrocarbons, of waste gases from industrial operations. 95 percent of the waste gases flared are natural gas, propane, pentane, ethylene, propylene, butadiene and butane. Rule 4311 contains operational requirements and flare minimization requirements for certain flares, and NOx and VOC emission limits for enclosed flares.

#### How does District Rule 4311 compare with federal and state rules and regulations?

#### **Federal Regulations**

There are no EPA Control Techniques Guidelines or Alternative Control Techniques applicable to this source category.

#### A. Standards of Performance for New Stationary Sources (NSPS)

District staff conducted a comprehensive evaluation of EPA NSPS requirements. The following NSPSs have not been updated since Rule 4311 was approved as meeting RACT requirements through EPA's approval of the 2014 RACT SIP. During this approval, it was determined that this rule met or exceeded RACT. Therefore, further evaluation is not necessary at this time.

- 40 CFR 60.18 General Control Device and Work Practice Requirements (2008/12)
- 40 CFR 65.147 Flares (2000/12)
- 40 CFR 60 Subpart OOOOa Standards of Performance for Crude Oil and Natural Gas Facilities for Which Construction, Modification, or Reconstruction Commenced After September 15, 2015 (2016/06)
- 40 CFR 60 Subpart Ja Standards of Performance for Petroleum Refineries for Which Construction, Reconstruction, or Modification Commenced After May 14, 2007 (2013/12)

## B. National Emission Standards for Hazardous Air Pollutions (NESHAPs) and Maximum Achievable Control Technologies (MACTs)

NESHAPs and MACTs are requirements contained in 40 Code of Federal Regulations (CFR) Part 61 and 40 CFR Part 63. Since EPA has delegated the authority to implement NESHAP requirements to the District, NESHAPs and MACTs promulgated by EPA are usually incorporated by reference into District Rule 4002 (National Emission

Standards for Hazardous Air Pollutants). It is important to mention that the District implements NESHAPs and MACTs by incorporating the emission standards as conditions of the Permits to Operate issued to affected sources. The following NESHAP has not been updated since EPA's approval of the 2014 RACT SIP, and therefore no further analysis is necessary at this time:

 40 CFR 63 Subpart SS - National Emission Standards for Closed Vent Systems, Control Devices, Recovery Devices and Routing to a Fuel Gas System or a Process (2002/07)

#### State Regulations

The following state regulation has not been amended since EPA's approval of the 2014 RACT SIP, and therefore no further evaluation is necessary at this time:

 CCR Title 17, Div. 3, Chapter 1, Subchapter 10, Article 4, Subarticle 13 -Greenhouse Gas Emission Standards for Crude Oil and Natural Gas Facilities (2017/03)

#### How does District Rule 4311 compare to rules in other air districts?

District staff compared emission limits, optional control requirements, and work practices in District Rule 4311 to comparable requirements in rules from the following nonattainment areas:

- Bay Area AQMD Regulation 12, Rule 11 (Adopted June 4, 2003)
- Bay Area AQMD Regulation 12, Rule 12 (Adopted July 20, 2005)
- Santa Barbara APCD Rule 359 (Amended June 28, 1994)
- South Coast AQMD Rule 1118 (Amended July 7, 2017)
- South Coast AQMD Rule 1118.1 (Adopted January 4, 2019)

Sacramento Metropolitan AQMD and Ventura County APCD do not have an analogous rule for this source category. Based on a review of rule requirements implemented prior to EPA's approval of the 2014 RACT SIP, District staff found that Rule 4311 continues to implement RACT levels of control. For the more recently amended rule, District staff is providing an analysis to demonstrate that RACT continues to be met. This analysis is presented below.

#### South Coast AQMD

SCAQMD Rule 1118.1 (Control of Emissions from Non-Refinery Flares)

	SJVAPCD Rule 4311	SCAQMD Rule 1118.1
Applicability	All flares	Flares that require a SCAQMD permit used at non-refinery facilities, including, but not limited to:  oil and gas production facilities  wastewater treatment facilities  landfills  organic liquid handling facilities

	SJVAPCD Rule 4311	SCAQMD Rule 1118.1
Exemptions	Municipal solid waste landfill flares subject to Rule 4642     Flares subject to 40 CFR 60 WWW or Cc     Stationary sources w/ potential to emit <10 tons VOC and <10 tons NOx per year (Not exempt from recordkeeping)	<ul> <li>Flares at asphalt plants; biodiesel plants; hydrogen production plants fueled in part with refinery gas; petroleum refineries; sulfuric acid plants; and sulfur recovery plants;</li> <li>Flares routing only natural gas to the burner that are subject to SCAQMD Rule 1147;</li> <li>Flares combusting only propane, butane, or a combination of propane and butane;</li> <li>Flares at closed landfills collecting less than 2,000 MMscf of landfill gas per calendar year;</li> <li>Flares with a various location permit;</li> <li>Flares combusting regeneration gas;</li> <li>Flares emitting less than 30 lb NOx/month;</li> <li>Flares with an annual throughput limit equivalent to 200 hr/year;</li> <li>Gas combusted during a utility pipeline curtailment is not used to calculate exceedance of use requirements</li> </ul>
Requirements	For sources greater than 10 tpy NO <sub>x</sub> or VOC: Open flares (airassisted, steam-assisted, or nonassisted): Comply with 40 CFR 60.18:  Ground level enclosed flares without steam assist: 0.0051 lb-VOC/MMBtu, 0.0952 lb-NOx/MMBtu (<10 MMBtu/hr); 0.0027 lb-VOC/MMBtu, 0.1330 l-NOx/MMBtu (10-100 MMBtu/hr); 0.0013 lb-VOC/MMBtu, 0.5240 lb-NOx/MMBtu (> 100 MMBtu/hr). Ground level enclosed flares with steam assist: 0.14 lb-VOC/MMBtu (all ratings); Recordkeeping and reporting; Flare minimization plan for refinery flares or flares ≥ 5.0 MMBtu/hr at major sources of NO <sub>x</sub> or VOC.	Throughput limits for new or replacement flares of 110% of replaced flare or 45 MMscf/year  New flare emission limits based on type of gas flared:  • Produced gas: 0.018 lb NOx/MMBtu, 0.01 lb CO/MMBtu, 0.008 lb VOC/MMBtu  • Landfill gas, and digester gas at a major facility: 0.025 lb NOx/MMBtu, 0.06 lb CO/MMBtu, 0.038 lb VOC/MMBtu  • Digester gas at a minor facility, and other flare gas: 0.06 lb NOX/MMBtu  • Organic liquid storage: 0.25 lb NOx/MMBtu, 0.37 lb CO/MMbtu  • Organic liquid loading: 0.034 lb NOx/1,000 gallons loaded, 0.05 lb CO/1,000 gallons loaded  Establishes requirements for existing flares not meeting the above emission limits based on exceeding a vocation based fractional use of total capacity in two consecutive calendar quarters. Fraction limits are:5% for produced gas or any open flare; 70% for digester gas; and 20% for landfill gas. Units exceeding these limits must reduce flaring or replace with a new flare meeting emission limit requirements.

Requirements for flare replacements under SCAQMD Rule 1118.1 could not be triggered until the beginning of 2021 based on calendar year 2020 data, and replacements would likely take well over 2 years, beyond 2023, to implement based on the Rule 1118.1 schedule and flexibilities with respect to applicability. The SCAQMD Rule 1118.1 limits for flares extend well beyond RACT, and have not been widely adopted in SIP rules. Additionally, the District's recent evaluations of ultra low-NOx flaring technologies have found cost-effectiveness extending well beyond RACT levels ranging from approximately \$40,000 to millions of dollars per ton of NOx emissions reduced.

#### Conclusion

District Rule 4311 varies in stringency when compared to other Agencies' requirements. For the majority of the categories, Rule 4311 is as stringent as or more stringent than the other Agencies' rules, and provides, at minimum, a RACT level of control for this source category.

## 4.7 RULE 4352 (SOLID FUEL FIRED BOILERS, STEAM GENERATORS, AND PROCESS HEATERS)

#### **District Rule 4352 Description**

Rule 4352 applies to solid fuel fired boilers, steam generators, and process heaters. Units subject to Rule 4352 are not subject to Rules 4351, 4305, 4306, 4307, and 4308 because these rules apply to boilers, steam generators, and process heaters fired on gaseous or liquid fuel.

District Rule 4352, last amended on 12/15/2011, requires units to meet the following NOx limits, based on a 24-hour block average.

Rule 4352 NOx Limits			
Fuel Type NOx Limit			
Municipal Solid Waste	165 ppmv corrected to 12% CO <sub>2</sub>		
Biomass 90 ppmv corrected to 3% 0			
Other	65 ppmv corrected to 3% O <sub>2</sub>		

How does District Rule 4352 compare with federal and state rules and regulations?

#### **Federal Regulations**

There are no EPA Control Techniques Guidelines applicable to this source category.

## A. EPA - Alternative Control Techniques (ACT)

District staff conducted a comprehensive evaluation of EPA ACT requirements. The following ACTs have not been updated since Rule 4352 was approved as meeting RACT requirements through EPA's approval of the 2014 RACT SIP. During this approval, it was determined that this rule met or exceeded RACT. Therefore, further evaluation is not necessary at this time.

- Alternative Control Techniques Document NO<sub>x</sub> Emissions from Industrial, Commercial, and Institutional Boilers (EPA-453/R-94-022 1994/03)
- Alternative Control Techniques Document NO<sub>x</sub> Emissions from Utility Boilers (EPA-453/R-94-023 1994/03)

#### B. New Source Performance Standards (NSPS)

District staff conducted a comprehensive evaluation of EPA NSPS requirements. The following NSPSs have not been updated since Rule 4352 was approved as meeting RACT requirements through EPA's approval of the 2014 RACT SIP. During this

approval, it was determined that this rule met or exceeded RACT. Therefore, further evaluation is not necessary at this time.

- 40 CFR 60 Subpart Cb Emission Guidelines and Compliance Times for Large Municipal Waste Combustors that are Constructed On or Before September 20, 1994 (1995/12)
- 40 CFR 60 Subpart D Standards of Performance for Fossil-Fuel-Fired Steam Generators (2007/06)
- 40 CFR 60 Subpart Da Standards of Performance for Electric Utility Steam Generating Units (2013/04)
- 40 CFR 60 Subpart Db Standards of Performance for Industrial-Commercial-Institutional Steam Generating Units (2007/06)
- 40 CFR 60 Subpart Dc Standards of Performance for Industrial-Commercial-Institutional Steam Generating Units (2014/02)
- 40 CFR 60 Subpart Ea Standards of Performance for Municipal Waste Combustors for which Construction is Commenced after December 20, 1989 and on or before September 20, 1994 (1995/12)
- 40 CFR 60 Subpart Eb Standards of Performance for Municipal Waste Combustors for which Construction is Commenced after September 20, 1994 or for which Modification or Reconstruction is Commenced after June 19, 1996 (2007/03)
- 40 CFR 60 Subpart AAAA Standards of Performance for Small Municipal Waste Combustion Units for Which Construction is Commenced after August 30, 1999 or for Which Modification is Commenced After June 6, 2001 (2003/01)
- 40 CFR 60 Subpart BBBB Standards of Performance for Small Municipal Waste Combustion Units Constructed on or before August 30, 1999 (2003/01)

## C. National Emission Standards for Hazardous Air Pollutants (NESHAPs) and Maximum Achievable Control Technologies (MACTs)

NESHAPs and MACTs are requirements contained in 40 Code of Federal Regulations (CFR) Part 61 and 40 CFR Part 63. Since EPA has delegated the authority to implement NESHAP requirements to the District, NESHAPs and MACTs promulgated by EPA are usually incorporated by reference into District Rule 4002 (National Emission Standards for Hazardous Air Pollutants). It is important to mention that the District implements NESHAPs and MACTs by incorporating the emission standards as conditions of the Permits to Operate issued to affected sources. The following NESHAP has not been updated since EPA's approval of the 2014 RACT SIP, and therefore no further evaluation is necessary at this time:

 40 CFR 63 Subpart DDDDD - National Emission Standards for Hazardous Air Pollutants for Major Sources: Industrial, Commercial, and Institutional Boilers and Process Heaters (2013/01)

### **State Regulations**

There are no state regulations applicable to this source category.

#### How does District Rule 4352 compare to rules in other air districts?

District staff compared emission limits, optional control requirements, and work practices in District Rule 4352 to comparable requirements in rules from the following:

- Bay Area AQMD Regulation 9, Rule 7 (Amended May 4, 2011)
- Bay Area AQMD Regulation 9, Rule 11 (Adopted May 17, 2000)
- Sacramento Metropolitan AQMD Rule 411 (Amended August 23, 2007)
- Yolo-Solano AQMD Rule 2-43 (Amended November 10, 2010)
- El Dorado County AQMD- Rule 232 (Amended September 25, 2001)
- Placer County APCD Rule 233 (Amended June 14, 2012)
- South Coast AQMD Rule 1146 (Amended December 7, 2018)

Ventura County APCD does not have an analogous rule for this source category. Based on a review of rule requirements implemented prior to EPA's approval of the 2014 RACT SIP, District staff found that Rule 4352 continues to implement RACT levels of control. For the more recently amended rule, District staff is providing an analysis to demonstrate that RACT continues to be met. This analysis is presented below.

#### South Coast AQMD

 South Coast AQMD Rule 1146 (Emissions of Oxides of Nitrogen from Industrial, Institutional, and Commercial Boilers, Steam Generators, and Process Heaters)

	SJVAPCD Rule 4352	SCAQMD Rule 1146
Applicability	NOx emission limit is applicable to any boiler, steam generator or process heater fired on solid fuel	Boilers, steam generators, and process heaters ≥ 5 MMBtu/hr rated heat input capacity used in all industrial, institutional, and commercial operations and fired on fossil-fuels
Exemption	NOx emission limits do not apply to units operated at a Stationary Source that has a potential to emit < 10 tpy of NOx	Units rated heat ≤ 5 MMBtu/hr.
Requirements Emission Limits	Municipal Solid Waste ≤ 165 ppmv NOx corrected to 12% CO₂  Biomass ≤ 90 ppmv NOx corrected to 3% O₂	No applicable requirements for electric utility boilers
	All others ≤ 65 ppmv NOx corrected to 3% O₂	

District staff evaluated the requirements contained within SCAQMD Rule 1146, including the 40 ppmv @ 3% O<sub>2</sub> limit for non-gaseous fuels. All solid-fuel fired (non-gaseous) boilers operating within the Valley are used by electric utilities to generate electricity, a category which SCAQMD specifically exempts from the requirements of

Rule 1146. Therefore, the 40 ppmv requirement in SCAQMD Rule 1146 would not apply to the solid-fuel fired boilers operating in the Valley.

There are two municipal solid waste-fired power plants located in the South Coast Air Basin; however, SCAQMD Rule 1146 is only applicable to fossil-fuel fired boilers, and municipal solid waste is not considered a fossil-fuel by definition.

South Coast AQMD enforces requirements for electricity generating facilities through SCAQMD Rule 1135 (Emissions of Oxides of Nitrogen from Electricity Generating Facilities), which applies to facilities of 50 MW or greater. However, the one solid-fuel fired biomass facility located in the South Coast Air Basin has a capacity of 47 MWs, and is therefore exempt from the requirements of SCAQMD Rule 1135. Similarly, based on a review of District permits, all solid-fuel fired biomass facilities in the Valley are under 50 MW in size. Therefore, the requirements of SCAQMD Rule 1135 would not apply to facilities in the Valley.

Based on District staff review, no sources in SCAQMD are currently complying with the SCAQMD Rule 1146 limit of 40 ppmv for non-gaseous limits, and this limit would not apply to the operating solid-fuel fired boilers located in the Valley.<sup>17</sup> Additionally, EPA's 2018 RACT approval found that the District's rule currently meets RACT, and the cost-effectiveness of additional potential control options would far exceed RACT.

#### Conclusion

District Rule 4352 meets or exceeds federal RACT requirements for this source category based upon evaluation of applicable federal regulations, state standards, and other air districts' rules.

<sup>&</sup>lt;sup>16</sup> Greenleaf Desert View Power, Riverside County (http://www.calbiomass.org/facilities-map/)

<sup>&</sup>lt;sup>17</sup> Approval and Disapproval of California Air Plan; San Joaquin Valley Serious Are Plan and Attainment Date Extension for the 1997 PM2.5 NAAQS. Final Rule. 81 Fed. (2016, February 9) (to be codified at 40 CFR Parts 52 and 81) <a href="https://www.gpo.gov/fdsys/pkg/FR-2016-02-09/pdf/2016-02325.pdf">https://www.gpo.gov/fdsys/pkg/FR-2016-02-09/pdf/2016-02325.pdf</a> and <a href="https://www.calbiomass.org/facilities-map/">https://www.calbiomass.org/facilities-map/</a>

## 4.8 RULE 4354 (GLASS MELTING FURNACES)

#### **District Rule 4354 Description**

The provisions of Rule 4354 are applicable to glass melting furnaces in the Valley. The purpose of this rule is to limit NOx, SOx, VOC, CO, and particulate matter (PM10) emissions from glass melting furnaces. Rule 4354 was adopted on September 14, 1994, and has been subsequently amended six times. EPA finalized approval of the most recent amendments to Rule 4354 on January 31, 2013, and deemed this rule as being as stringent as or more stringent than established RACT requirements. As a result of this stringent prohibitory rule and continuing efforts on behalf of this industry to reduce emissions, the Valley is home to six glass-making facilities with glass melting furnaces that utilize the most advanced low-NOx firing technology. The NOx emission limits contained within Rule 4354 require the installation of the best available NOx technology (i.e. oxy-fuel firing or SCR systems).

How does District Rule 4354 compare with federal and state rules and regulations?

#### Federal Regulations

There are no EPA Control Techniques Guidelines requirements for this source category.

#### A. Alternative Control Techniques (ACT)

District staff conducted a comprehensive evaluation of EPA ACT requirements. The following ACTs have not been updated since Rule 4354 was approved as meeting RACT requirements through EPA's approval of the 2014 RACT SIP. During this approval, it was determined that this rule met or exceeded RACT. Therefore, further evaluation is not necessary at this time.

• NO<sub>x</sub> Emissions from Glass Manufacturing (EPA-453/R-94-37 1994/06)

#### B. New Source Performance Standards (NSPS)

District staff conducted a comprehensive evaluation of EPA NSPS requirements. The following NSPS has not been updated since Rule 4354 was approved as meeting RACT requirements through EPA's approval of the 2014 RACT SIP. During this approval, it was determined that this rule met or exceeded RACT. Therefore, further evaluation is not necessary at this time.

- 40 CFR 60 Subpart CC Standards of Performance for Glass Manufacturing Plants
- 40 CFR 60 Subpart PPP Standards of Performance for Wool Fiberglass Manufacturing Plants (Amended October 17, 2000)

## C. National Emission Standards for Hazardous Air Pollutants (NESHAPs) and Maximum Achievable Control Technologies (MACTs)

NESHAPs and MACTs are requirements contained in 40 Code of Federal Regulations (CFR) Part 61 and 40 CFR Part 63. Since EPA has delegated the authority to implement NESHAP requirements to the District, NESHAPs and MACTs promulgated by EPA are usually incorporated by reference into District Rule 4002 (National Emission Standards for Hazardous Air Pollutants). It is important to mention that the District implements NESHAPs and MACTs by incorporating the emission standards as conditions of the Permits to Operate issued to affected sources.

The following NESHAPs have not been updated since Rule 4354 was approved as meeting RACT requirements through EPA's approval of the 2014 RACT SIP. During this approval, it was determined that this rule met or exceeded RACT. Therefore, further evaluation is not necessary at this time.

- 40 CFR 61 Subpart N National Emission Standard for Inorganic Arsenic Emissions from Glass Manufacturing Plants (1986/08)
- 40 CFR 63 Subpart NN National Emission Standards for Hazardous Air Pollutants for Wool Fiberglass Manufacturing at Area Sources (2015/07)
- 40 CFR 63 Subpart NNN National Emission Standards for Hazardous Air Pollutants for Wool Fiberglass Manufacturing (2017/12)
- 40 CFR 63 Subpart SSSSS National Emission Standards for Hazardous Air Pollutants for Glass Manufacturing Area Sources (2007/12)

For the following, more recently amended NESHAP, District staff is providing an evaluation to demonstrate that RACT continues to be met.

 40 CFR 63 Subpart HHHH - National Emission Standards for Hazardous Air Pollutants for Wet-Formed Fiberglass Mat Production (2019/02)

This NESHAP only contains emission limits and regulations to reduce formaldehyde emissions from each drying or curing oven used as a part of a wet-formed fiberglass mat production facility. Since this subpart does not contain any requirements specifically for glass melting furnaces, it does not regulate NO<sub>X</sub> or VOC emissions for this source category. Therefore, the requirements of this subpart cannot define RACT for this source category and no further evaluation is necessary.

### **State Regulations**

There are no state regulations applicable to this source category.

How does District Rule 4354 compare to rules in other air districts?

District staff compared emission limits, optional control requirements, and work practices in District Rule 4354 to comparable requirements in rules from the following California nonattainment areas:

- Bay Area AQMD Regulation 9, Rule 12 (Adopted January 19, 1994)
- South Coast AQMD Rule 1117 (Amended January 6, 1984)

Sacramento Metropolitan AQMD and Ventura County APCD do not have an analogous rule for this source category. The following analyses compare District requirements with the requirements of the remaining above-listed rules:

#### Bay Area AQMD

BAAQMD Regulation 9, Rule 12 (Nitrogen Oxides from Glass Melting Furnaces)

• BAAQIVID REQ	gulation 9, Rule 12 (Nitrogen Oxides from Glass Meiting Furnaces)			
	SJVAPCD Rule 4354		BAAQMD Reg 9, Rule 12	
Applicability	The provisions of this rule shall apply to any glass melting furnace for the production of, container glass, fiberglass, and flat glass		This rule limits the emission of nitrogen oxides (NOx) from glass melting furnaces	
Exemption	<ul> <li>Furnaces which heat is provided by electric current from electrodes.</li> <li>Any glass melting furnace that is part of a stationary source with a total potential to emit for all processes, less than 10.0 tons/yr of NO<sub>X</sub> and less than 10.0 tons/yr of VOC.</li> </ul>		<ul> <li>Furnaces which heat is provided by electric current from electrodes.</li> <li>Furnaces with a production capacity of 4550 kg (5 short tons) of glass per day or less.</li> </ul>	
Requirements		Contain	er Glass:	
	NO <sub>X</sub>	1.5 lb/ton <sup>B</sup>	5.5 lb/ton, averaged over any consecutive 3- hour period	
	VOC (100% air-fired)	20 ppmv @ 8% O <sub>2</sub> (based on 3 hr avg)	No VOC	
	VOC (oxy-fuel/oxygen assisted)	0.25 lb/ton (based on 3 hr avg)	Limits Specified	
	Fiber		rglass:	
	NO <sub>X</sub> 1.3 lb/ton <sup>A, C</sup> 3.0 lb/ton <sup>A, D</sup>		5.5 lb/ton, averaged over any consecutive 3- hour period	
	VOC	No Limit Specified	No Limit Specified	
		Flat	Glass:	
	NO <sub>X</sub> Standard	3.7 lb/ton <sup>A</sup>		
	Option	3.2 lb/ton <sup>B</sup>	5.5 lb/ton, averaged over any consecutive 3-	
	NO <sub>x</sub> Enhanced	3.4 lb/ton <sup>A</sup>	hour period	
	Option	2.9 lb/ton <sup>B</sup>		
	VOC (100% air-fired)	20 ppmv @ 8% O <sub>2</sub> (based on 3 hr avg)	No VOC	
A Plack 24 hour group	VOC (oxy-fuel/oxygen assisted)	0.10 lb/ton (based on 3 hr avg)	Limits Specified	

A Block 24-hour average

<sup>&</sup>lt;sup>B</sup> Rolling 30-day average

<sup>&</sup>lt;sup>C</sup> Not subject to California Public Resources Code Section 19511

<sup>&</sup>lt;sup>D</sup> Subject to California Public Resources Code Section 19511

The District evaluated the control requirements in BAAQMD Regulation 9 Rule 12, and found no requirements that were more stringent than those already in Rule 4354.

#### South Coast AQMD

SCAQMD Rule 1117, Emissions of Oxides of Nitrogen from Glass Melting Furnaces

33.10.112.11		CD Rule 4354	SCAQMD Rule 1117
Applicability	The provisions of t	his rule shall apply to any	This rule limits the emission of nitrogen
	glass melting furnace for the production of, container glass, fiberglass, and flat glass		oxides (NOx) from glass melting furnaces.
Exemption	<ul> <li>Furnaces which heat is provided by electric current from electrodes.</li> <li>Any glass melting furnace that is part of a stationary source with a total potential to emit for all processes, less than 10.0 tons/yr of NO<sub>X</sub> and less than 10.0 tons/yr of VOC.</li> </ul>		<ul> <li>Furnaces which are limited by Permit to operate to 15 lbs/hour of NOx or less.</li> <li>Glass remelt facilities using exclusively glass cullet, marbles, chips, or similar feedstock in lieu of basic glass-making raw materials.</li> <li>Furnaces used in the melting of glass for the production of glass tableware exclusively.</li> <li>Flat glass melting furnaces.</li> <li>Furnaces used in the melting of glass for the production of fiberglass exclusively.</li> <li>Idling furnaces.</li> </ul>
Requirements		Contair	ner Glass:
	NO <sub>X</sub>	1.5 lb/ton <sup>B</sup>	4.0 lb/ton <sup>A</sup>
	VOC (100% air-fired)	20 ppmv @ 8% O <sub>2</sub> (based on 3 hr avg)	No VOC
	VOC (oxy-fuel/oxygen assisted)	0.25 lb/ton (based on 3 hr avg)	Limits Specified
	Fiber		rglass:
	NO <sub>X</sub>	1.3 lb/ton <sup>A, C</sup>	No Limit Specified, Exempt from Rule
		3.0 lb/ton <sup>A, D</sup>	
	VOC	No Limit Specified	No Limit Specified, Exempt from Rule
		Flat	Glass:
	NO <sub>X</sub> Standard	3.7 lb/ton <sup>A</sup>	
	Option  NO <sub>X</sub> Enhanced	3.2 lb/ton <sup>B</sup>	No Limits Specified, Exempt from Rule
		3.4 lb/ton <sup>A</sup>	No Limito Opcomed, Exempt from Nate
	Option	2.9 lb/ton <sup>B</sup>	
	VOC (100% air-fired)	20 ppmv @ 8% O <sub>2</sub> (based on 3 hr avg)	No Limite Constitut Formation D
A Block 24-hour average	VOC (oxy-fuel/oxygen assisted)	0.10 lb/ton (based on 3 hr avg)	No Limits Specified, Exempt from Rule

<sup>&</sup>lt;sup>A</sup> Block 24-hour average

The District evaluated the control requirements in SCAQMD Rule 1117, and found no requirements that were more stringent than those already in Rule 4354. District staff

<sup>&</sup>lt;sup>B</sup> Rolling 30-day average

<sup>&</sup>lt;sup>C</sup> Not subject to California Public Resources Code Section 19511

<sup>&</sup>lt;sup>D</sup> Subject to California Public Resources Code Section 19511

note that SCAQMD is currently developing potential amendments to Rule 1117 that may lower the NOx emission limits contained in the rule. The current requirements established in District Rule 4354 and SCAQMD Rule 1117 have been previously approved by EPA as implementing, at minimum, a RACT level of stringency. Potential new requirements that may result from the SCAQMD rule development process would go beyond RACT levels of control.

#### Conclusion

District Rule 4354 meets or exceeds federal RACT requirements for this source category based upon evaluation of applicable federal regulations, state standards, and other air districts' rules.

## 4.9 RULE 4623 (STORAGE OF ORGANIC LIQUIDS)

#### **District Rule 4623 Description**

The purpose of this rule is to limit volatile organic compound (VOC) emissions from the storage of organic liquids to any tank with a capacity of 1,100 gallons or greater.

This rule requires storage of organic liquids in tanks to be equipped with one of the following VOC control systems: (A) pressure-vacuum relief valves; (B) internal floating roof; (C) external floating roof; (D) a fixed roof tank with vapor recovery system of at least 95% control efficiency, or (E) pressure vessel. Specific control requirements vary depending on the tank capacity and TVP of the stored liquid.

How does District Rule 4623 compare with federal and state rules and regulations?

#### **Federal Regulations**

There are no EPA Alternative Control Techniques applicable to this source category.

#### A. Control Technique Guidelines (CTG)

District staff conducted a comprehensive evaluation of EPA CTG requirements. The following CTGs have not been updated since Rule 4623 was approved as meeting RACT requirements through EPA's approval of the 2014 RACT SIP. During this approval, it was determined that this rule met or exceeded RACT. Therefore, further evaluation is not necessary at this time.

- Control of Volatile Organic Emissions from Storage of Petroleum Liquids in Fixed-Roof Tanks (EPA-450/2-77-036 1977/12)
- Control of Volatile Organic Emissions from Petroleum Liquid Storage in External Floating Roof Tanks (EPA-450/2-78-047 1978/12)

#### B. Standards of Performance for New Stationary Sources (NSPS)

District staff conducted a comprehensive evaluation of EPA ACT requirements. The following ACTs have not been updated since Rule 4623 was approved as meeting RACT requirements through EPA's approval of the 2014 RACT SIP. During this approval, it was determined that this rule met or exceeded RACT. Therefore, further evaluation is not necessary at this time.

- 40 CFR 60 Subpart K Standards of Performance for Storage Vessels for Petroleum Liquids for Which Construction, Reconstruction, or Modification Commenced after June 11, 1973, and Prior to May 19, 1978 (2012/09)
- 40 CFR 60 Subpart Ka Standards of Performance for Storage Vessels for Petroleum Liquids for Which Construction, Reconstruction, or Modification Commenced after May 18, 1978, and Prior to July 23, 1984 (2000/12)

- 40 CFR 60 Subpart Kb Standards of Performance for Volatile Organic Liquid Storage Vessels (Including Petroleum Liquids Storage Vessels) for Which Construction, Reconstruction, or Modification Commenced after July 23, 1984 (2000/12)
- C. National Emission Standards for Hazardous Air Pollutions (NESHAPs) and Maximum Achievable Control Technologies (MACTs)

NESHAPs and MACTs are requirements contained in 40 Code of Federal Regulations (CFR) Part 61 and 40 CFR Part 63. Since EPA has delegated the authority to implement NESHAP requirements to the District, NESHAPs and MACTs promulgated by EPA are usually incorporated by reference into District Rule 4002 (National Emission Standards for Hazardous Air Pollutants). It is important to mention that the District implements NESHAPs and MACTs by incorporating the emission standards as conditions of the Permits to Operate issued to affected sources. The following NESHAP has not been updated since EPA's approval of the 2014 RACT SIP:

 40 CFR 63 Subpart BBBBB - Gasoline Distribution Facilities (Bulk Gasoline Terminal and Pipeline Breakout Station) (2011/01)

For the following, more recently amended NESHAP, District staff is providing an evaluation to demonstrate that RACT continues to be met.

• 40 CFR 63 Subpart EEEE - Organic Liquids Distribution (Non-Gasoline) (2020/03)

This NESHAP applies to various equipment and components used in organic liquids distribution, including organic liquids storage tanks.

The NESHAP requires emissions from storage tank with capacity greater than 5,000 gallons be routed through a closed vent system into any combination of control devices achieving at least 95 weight-percent HAP reduction, or a reduction to an exhaust concentration less than or equal to 20 ppmv (control devices must meet applicable testing, monitoring and operating standards depending on type of device).

#### **Emission Control Requirements**

District Rule 4623 requires the storage vessel with capacity of 1,100 gallons or greater be equipped with a VOC control system, including a VOC control device with a minimum control efficiency of 95%, whereas this NESHAP requires the storage vessel with capacity greater than 5,000 gallons be equipped with a VOC control system that achieving a minimum control efficiency of 95%.

Based on the discussion above and taking all the comparison categories into consideration; District Rule 4623 is more stringent than this CTG because it applies to storage vessels with capacity of 1,100 gallons or greater, compared to the CTG's applicability to storage vessel with capacity greater than 5,000 gallons.

#### **State Regulations**

There are no State Regulations applicable to this source category.

#### How does District Rule 4623 compare to rules in other air districts?

District staff compared emission limits, optional control requirements, and work practices in District Rule 4623 to comparable requirements in rules from the following nonattainment areas:

- Bay Area AQMD Regulation 8, Rule 5 (Amended October 18, 2006)
- Sacramento Metropolitan AQMD Rule 446 (Amended November 16, 1993)
- Ventura County APCD Rule 71.2 (Amended September 26, 1989)
- South Coast AQMD Rule 463 (Amended November 4, 2011)

Based on a review of rule requirements implemented by other air districts for this source category, District staff found that Rule 4623 continues to implement RACT levels of control.

#### Conclusion

District Rule 4623 meets or exceeds federal RACT requirements for this source category based upon evaluation of applicable federal regulations, state standards, and other air districts' rules.

## 4.10 RULE 4624 (TRANSFER OF ORGANIC LIQUID)

#### **District Rule 4624 Rule Description**

The purpose of this rule is to limit VOC emissions from the transfer of organic liquids, which are liquids that contain VOCs and have a True Vapor Pressure (TVP) of 1.5 psia or greater at the storage container's maximum organic liquid storage temperature.

Facilities transferring 20,000 gallons or more per day of organic liquid must comply with a VOC emission limit of 0.08 lb per 1,000 gallons, use bottom loading, and route VOC vapors to a vapor collection and control system, a fixed roof container, a floating roof container, a pressure vessel, or other closed VOC emission control system. Facilities transferring less than 20,000 gallons per day of organic liquid must capture at least 95% of VOC vapors displaced during loading, use bottom loading, and route VOC vapors to a vapor collection and control system, a fixed roof container, a floating roof container, a pressure vessel, or other closed VOC emission control system.

Pressure in the delivery tank being loaded must be maintained within the range of 18 inches water column pressure and six (6) inches water column vacuum. Delivery tanks which previously contained organic liquids shall be filled only at transfer facilities that are compliant with the vapor capture requirements. Transfer racks and vapor collection equipment shall have no leaks and no excess organic liquid drainage at disconnections. New top loading facilities or the expansions of any existing one are prohibited.

How does District Rule 4624 compare with federal and state rules and regulations?

#### **Federal Regulations**

There are no Alternative Control Techniques for this source category.

#### A. Control Technique Guidelines (CTG)

District staff conducted a comprehensive evaluation of EPA CTG requirements. The following CTG has not been updated since Rule 4624 was approved as meeting RACT requirements through EPA's approval of the 2014 RACT SIP. During this approval, it was determined that this rule met or exceeded RACT. Therefore, further evaluation is not necessary at this time.

Control of Hydrocarbons from Tank Truck Gasoline Loading Terminals (EPA-450/2-77-026 1977/10)

#### B. Standards of Performance for New Stationary Sources (NSPS)

District staff conducted a comprehensive evaluation of EPA NSPS requirements. The following NSPSs have not been updated since Rule 4624 was approved as meeting RACT requirements through EPA's approval of the 2014 RACT SIP. During this

approval, it was determined that this rule met or exceeded RACT. Therefore, further evaluation is not necessary at this time.

- 40 CFR 60 Subpart XX Standards of Performance for Bulk Gasoline Terminals (2003/12)
- C. National Emission Standards for Hazardous Air Pollutions (NESHAPs) and Maximum Achievable Control Technologies (MACTs)

NESHAPs and MACTs are requirements contained in 40 Code of Federal Regulations (CFR) Part 61 and 40 CFR Part 63. Since EPA has delegated the authority to implement NESHAP requirements to the District, NESHAPs and MACTs promulgated by EPA are usually incorporated by reference into District Rule 4002 (National Emission Standards for Hazardous Air Pollutants). It is important to mention that the District implements NESHAPs and MACTs by incorporating the emission standards as conditions of the Permits to Operate issued to affected sources.

The following NESHAP has not been updated since EPA's approval of the 2014 RACT SIP:

 40 CFR 63 Subpart BBBBB - Gasoline Distribution Facilities (Bulk Gasoline Terminal and Pipeline Breakout Station (2011/01)

For the following, more recently amended NESHAP, District staff is providing an evaluation to demonstrate that RACT continues to be met.

• 40 CFR 63 Subpart EEEE - Organic Liquids Distribution (Non-Gasoline) (2020/03)

This NESHAP applies to various equipment and components used in organic liquids distribution, including loading racks.

The NESHAP requires that vapors displaced during loading (1) be routed through a closed vent system into any combination of control devices achieving at least 98 weight-percent HAP reduction, or a reduction to an exhaust concentration less than or equal to 20 ppmv (control devices must meet applicable testing, monitoring and operating standards depending on type of device); (2) be routed into fuel gas systems or back into a process; or (3) captured in a vapor balancing system that routes organic HAP vapors to the storage tank from which the liquid being loaded originated or to another storage tank connected to a common header.

The requirements of District Rule 4624 and 40 CFR 63 Subpart EEEE are similar as far as the collection and disposal of vapors displaced during organic liquid loading is concerned. However, it is not possible to compare destruction efficiencies of the control equipment directly because District Rule 4624 addresses primarily VOC (requiring a destruction efficiency of 95%), while 40 CFR 63 Subpart EEEE addresses HAPs

(requiring a destruction efficiency of 98%). Additionally, the District implements 40 CFR 63 Subpart EEEE by reference under District Rule 4002.

# State Regulations

District staff conducted a comprehensive evaluation of California regulatory requirements. The following state regulations have not been updated since Rule 4624 was approved as meeting RACT requirements through EPA's approval of the 2014 RACT SIP. During this approval, it was determined that this rule met or exceeded RACT. Therefore, further evaluation is not necessary at this time.

- California Air Resources Board (CARB) Executive Order G-70-124M for Vapor Recovery Systems Installed on Gasoline Bulk Plants (1999/10)
- California Air Resources Board (CARB) Executive Order G-70-126M for Vapor Recovery Systems Installed on Gasoline Bulk Terminals (1996/12)

# How does District Rule 4624 compare to rules in other air districts?

District staff compared emission limits, optional control requirements, and work practices in District Rule 4624 to comparable requirements in rules from the following nonattainment areas:

- Bay Area AQMD Regulation 8, Rule 6 (Amended February 2, 1994)
- Bay Area AQMD Regulation 8, Rule 33 (Amended April 15, 2009)
- Bay Area AQMD Regulation 8, Rule 39 (Amended April 15, 2009)
- Sacramento Metropolitan AQMD Rule 447 (Amended April 2, 1998)
- Ventura County APCD Rule 70 (Amended April 1, 2009)
- Ventura County APCD Rule 71.3 (Amended June 16, 1992)
- South Coast AQMD Rule 462 (Amended May 14, 1999)
- South Coast AQMD Rule 1142 (Amended July 19, 1991)

Based on a review of rule requirements implemented by other air districts for this source category, District staff found that Rule 4624 continues to implement RACT levels of control.

#### Conclusion

District Rule 4624 meets or exceeds federal RACT requirements for this source category based upon evaluation of applicable federal regulations, state standards, and other air districts' rules.

# 4.11 RULE 4702 (INTERNAL COMBUSTION ENGINES)

# **District Rule 4702 Description**

Rule 4702 applies to any internal combustion (IC) engine rated at 25 brake horsepower (bhp) or greater. The purpose of this rule is to limit NOx, CO, VOC, and SOx emissions from units subject to this rule. Rule 4702 has significantly reduced emissions from non-agricultural and agricultural IC engines, with substantial investments being made by the affected sources to comply with the rule. The August 2011 amendments to Rule 4702 strengthened the rule by implementing more stringent NOx emission limits as low as 11 ppmv for certain spark-ignited engines used in non-agricultural operations.

How does District Rule 4702 compare with federal and state rules and regulations?

# **Federal Regulations**

There are no EPA Control Technique Guidelines requirements for this source category.

# A. Alternative Control Techniques (ACT)

District staff conducted a comprehensive evaluation of EPA ACT requirements. The following ACTs have not been updated since Rule 4702 was approved as meeting RACT requirements through EPA's approval of the 2014 RACT SIP. During this approval, it was determined that this rule met or exceeded RACT. Therefore, further evaluation is not necessary at this time.

 Alternative Control Techniques Document - NOx Emissions from Stationary Reciprocating Internal Combustion Engines (EPA-453/R-93-032 1993/07, updated 2000/09)

# B. Standards of Performance for New Stationary Sources (NSPS)

District staff conducted a comprehensive evaluation of EPA NSPS requirements. The following NSPS has not been updated since Rule 4702 was approved as meeting RACT requirements through EPA's approval of the 2014 RACT SIP. During this approval, it was determined that this rule met or exceeded RACT. Therefore, further evaluation is not necessary at this time.

 40 CFR 60 Subpart JJJJ - Standards of Performance for Stationary Spark Ignition Internal Combustion Engines (2013/01)

For the following, more recently amended, NESHAP, District staff is providing an evaluation to demonstrate that RACT continues to be met.

 40 CFR 60 Subpart IIII - Standards of Performance for Stationary Compression Ignition Internal Combustion Engines (2019/11)

The New Source Performance Standards (NSPS) of 40 CFR 60 Subpart IIII — Standards of Performance for Stationary Compression Ignition Internal Combustion Engines apply to stationary compression-ignition IC engines. 40 CFR 60 Subpart IIII establishes emission certification requirements for manufacturers of stationary compression-ignition IC engines. 40 CFR 60 Subpart IIII also establishes emission requirements for owners and operators of compression-ignition IC engines for which construction commenced after July 11, 2005 and the engine was manufactured after April 1, 2006 for engines that are not fire pump engines and for owners and operators of compression-ignition IC engines for which construction commenced after July 11, 2005 and the engine was manufactured after July 1, 2006 for engines that were manufactured as certified National Fire Protection Association (NFPA) fire pump engines after July 1, 2006.

In 2014, the District evaluated the requirements of 40 CFR 60 Subpart IIII for the District's Reasonably Available Control Technology (RACT) Demonstration for the 8-Hour Ozone State Implementation Plan (SIP) (June 19, 2014) and determined that Rule 4702 was at least as stringent as 40 CFR 60 Subpart IIII. Since that time 40 CFR 60 Subpart IIII has been amended twice – once on July 7, 2016 and once on October 13, 2019.

The July 7, 2016 amendments to 40 CFR 60 Subpart IIII allowed manufacturers to design stationary compression-ignition IC engines so that operators can temporarily override inducements that require operation of add-on emission control systems (i.e. selective catalytic reduction (SCR)) during qualified emergency situations where the operation of the engine or equipment is needed to protect human life and to require that the engines comply with Tier 1 emission standards during such emergencies when the add-on controls are not operating. In addition, the July 7, 2016 amendments extended the provisions that allow less stringent requirements for areas of Alaska that are not accessible by the Federal Aid Highway System (FAHS) to other remote areas of Alaska with limited accessibility, consistent with the definition of remote areas in 40 CFR 63 Subpart ZZZZ - National Emission Standards for Hazardous Air Pollutants (NESHAP) for Reciprocating Internal Combustion Engines (RICE).

The November 13, 2019, amendments to 40 CFR 60 Subpart IIII removed the requirement that model year 2014 and later stationary compression-ignition IC engines located in remote areas of Alaska must comply with the Tier 4 PM emission standards and instead required that these engines comply with Tier 3 PM emission standards. These amendments did not increase the stringency of any requirements in 40 CFR 60 Subpart IIII and parts of the amendments were only applicable to IC engines located in remote regions of Alaska.

Therefore, the determination that Rule 4702 is at least as stringent as 40 CFR 60 Subpart IIII remains valid.

# C. National Emission Standards for Hazardous Air Pollutants (NESHAPs) and Maximum Achievable Control Technologies (MACTs)

NESHAPs and MACTs are requirements contained in 40 Code of Federal Regulations (CFR) Part 61 and 40 CFR Part 63. Since EPA has delegated the authority to implement NESHAP requirements to the District, NESHAPs and MACTs promulgated by EPA are usually incorporated by reference into District Rule 4002 (National Emission Standards for Hazardous Air Pollutants). It is important to mention that the District implements NESHAPs and MACTs by incorporating the emission standards as conditions of the Permits to Operate issued to affected sources.

The following NESHAP has not been updated since Rule 4702 was approved as meeting RACT requirements through EPA's approval of the 2014 RACT SIP. During this approval, it was determined that this rule met or exceeded RACT. Therefore, further evaluation is not necessary at this time.

 40 CFR 63 Subpart ZZZZ - National Emissions Standards for Hazardous Air Pollutants for Stationary Reciprocating Internal Combustion Engines (2013/01)

# **State Regulations**

District staff conducted a comprehensive evaluation of California regulatory requirements. The following state regulations have not been updated since Rule 4702 was approved as meeting RACT requirements through EPA's approval of the District's 2014 RACT SIP. During this approval, it was determined that this rule met or exceeded RACT. Therefore, further evaluation is not necessary at this time.

- California Environmental Protection Agency Air Resources Board Determination of Reasonably Available Control Technology and Best Available Retrofit Control Technology for Stationary Spark-Ignited Internal Combustion Engines (2001/11)
- Title 17 California Code of Regulations (CCR), Section 93115 Airborne Toxic Control Measure (ATCM) for Stationary Compression-Ignition (CI) Engines (2004/02)
- Title 17 California Code of Regulations (CCR), Section 93116 Airborne Toxic Control Measure (ATCM) for Diesel Particulate Matter from Portable Engines Rated at 50 Horsepower and Greater (2004/02)

# How does District Rule 4702 compare to rules in other air districts?

District staff compared emission limits, optional control requirements, and work practices in District Rule 4702 to comparable requirements in rules from the following nonattainment areas:

- Bay Area AQMD Regulation 9, Rule 8 (Amended July 25, 2007)
- Sacramento Metropolitan AQMD Rule 412 (Adopted June 1, 1995)
- Ventura County APCD Rule 74.9 (Amended November 8, 2005)

- Ventura County APCD Rule 74.16 (Adopted January 8, 1991)
- South Coast AQMD Rule 1110.2 (Amended November 1, 2019)

Based on a review of rule requirements implemented prior to EPA's approval of the District's 2014 RACT SIP, District staff found that Rule 4702 continues to implement RACT levels of control. For more recently amended rules, District staff is providing an analysis to demonstrate that RACT continues to be met. This analysis is presented below.

### South Coast AQMD

SCAQMD Rule 1110.2 (Emissions from Gaseous- And Liquid-Fueled Engines)

	SJVAPCD Rule 4702	SCAQMD Rule 1110.2
Applicability	Internal combustion engine rated at ≥ 25 bhp	Stationary and portable IC engines rated more than 50 bhp
Exemption	Limited to operate less than 100 hrs/yr  De-rated engine that has been physically limited and restricted by permit to an operational level of < 50 hp not used in agricultural operation (prior to 6/1/04)  De-rated engine that has been physically limited and restricted by permit to an operational level of < 50 bhp used in agricultural operation (prior to 6/1/05)	<ul> <li>IC engines powering orchard wind machines;</li> <li>Emergency IC engines permitted to operate no more than 200 hours per year;</li> <li>Laboratory IC engines used in research and testing purposes;</li> <li>IC Engines operated for purposes of performance verification and testing of engines;</li> <li>Auxiliary IC engines used to power other engines or gas turbines during start-ups;</li> <li>Portable engines that are registered under the state Portable Equipment Registration Program (PERP)</li> <li>IC engines operating on San Clemente Island;</li> <li>Tier 4 certified stationary agricultural IC engines for which the electric utility rejected an application for an electrical line extension to the engine location or that do not qualify for Carl Moyer Program funding;</li> <li>IC engine start-up periods, until sufficient operating temperatures are reached for proper operation of emission control equipment or for the tuning of the engines and/or emission control equipment, and engine shutdown periods. The periods shall not exceed 30 minutes, unless a longer period, not exceeding two hours, is approved in writing;</li> <li>IC engine start-ups, after an engine overhaul or major repair, or the replacement of catalytic emission control equipment, for a period not to exceed four operating hours;</li> <li>Initial commissioning of a new IC engine for a period not exceeding 150 operating hours;</li> <li>Ic engines rated 100 bhp or less used exclusively for electrical generation at remote two-way radio transmission towers where no utility, electricity, or natural gas is available within a ½ mile radius, and is fired exclusively on diesel #2, compressed natural gas, or liquefied petroleum gas;</li> <li>NOx emissions from existing IC engines subject to SCAQMD RECLAIM Applicability);</li> <li>IC engines operated in either the Southern California Coastal Waters or Outer Continental Shelf Waters that power cranes and are certified to meet the Tier 4 Final emission standards</li> </ul>

	SJVAPCD Rule 4702	SCAQMD Rule 1110.2		
		<ul> <li>The facility operator of MM PRIMA DESHECHA ENERGY, LLC provided that a plan was submitted before July 1, 2016 for the permanent shutdown of all equipment subject to Rule 1110.2 by October 1, 2022; and</li> <li>IC engines located at landfills or publicly owned treatment works that are subject to a NOx emission limit in a Regulation XI rule adopted or amended after November 1, 2019</li> </ul>

NOx	Tier 3 or Tier 4 Certified IC Engine	11 ppmv, or Tier 4 Certified IC Engine by Jan 1, 2014 for IC engines for which the electric utility rejected an electrical line extension application or that did not qualify for Carl Moyer funding due to no fault of the operator		
VOC	Tier 3 or Tier 4 Certified IC Engine	30 ppmv, or Tier 4 Certified IC Engine by Jan 1, 2014 for IC engines for which the electric utility rejected an electrical line extension application or that did not qualify for Carl Moyer funding due to no fault of the operator		
New Stationary Non-Emergency IC Engines Powering Electrical Generators				
(lb-MW-hr or ppmv @ 15% oxygen on a dry basis)				
NOx	No Such Cotogony	0.070 lb/MW-hr* or 2.5 ppmv		
VOC	No Such Category	0.010 lb/MW-hr* or 2.5 ppmv		

<sup>\*</sup> IC engines that comply with the lb/MW-hr limits and produce combined heat and electrical power may include one megawatt-hour (MW-hr) for each 3.4 million Btus of useful heat recovered (MWth-hr), in addition to each MW-hr of net electricity produced (MWe-hr).

As established by SCAQMD, the current emission requirements of SCAQMD Rule 1110.2 are equivalent to Best Available Control Technology (BACT) requirements of New Source Review (NSR)<sup>21</sup> and SCAQMD also previously determined that the current emission requirements of SCAQMD Rule 1110.2 satisfied Lowest Achievable Emission Rate (LAER) requirements of Federal NSR for a digester gas-fired IC engine.<sup>22</sup> The recent determinations by SCAQMD that the SCAQMD Rule 1110.2 emission limits are equivalent to BACT and LAER makes it clear that these emission limits go far beyond what is required for RACT.

<sup>&</sup>lt;sup>18</sup> There are only 2 rich-burn spark ignited engines operating in SCAQMD per discussions with SCAQMD staff

<sup>&</sup>lt;sup>19</sup> There are no lean-burn spark ignited ag engines operating in SCAQMD per discussions with SCAQMD staff

<sup>&</sup>lt;sup>20</sup> Information from SCAQMD indicates that there are no stationary non-emergency diesel IC engines that operate in the SCAQMD

South Coast Air Quality Management District Best Available Control Technology Guidelines (February 2, 2018),

The requirements established in District Rule 4702 and SCAQMD Rule 1110.2 (as of the previous amendment date of June 3, 2016) have been approved by EPA as implementing, at minimum, a RACT level of stringency. The requirements established in the recent amendments of SCAQMD Rule 1110.2 for internal combustion engines go beyond RACT, and have not been widely adopted in SIP rules. Additionally, given the District's existing stringent limits, the cost-effectiveness associated with the installation of additional controls will be far in excess of RACT cost-effectiveness levels.

#### Conclusion

District Rule 4702 meets or exceeds federal RACT requirements for this source category based upon evaluation of applicable federal regulations, state standards, and other air districts' rules.

# 4.12 RULE 4703 (STATIONARY GAS TURBINES)

# **District Rule 4703 Description**

Rule 4703 limits  $NO_X$  and CO emissions from stationary gas turbines with a ratings equal to or greater than of 0.3 MW or a maximum heat input of more than 3.0 MMBtu/hr. The main rule requirement is the limitation of  $NO_X$  emissions. Laboratory units used in research and testing for the advancement of gas turbine technology, units limited by permit condition to be operated exclusively for firefighting and/or flood control, and emergency standby units limited by permit condition to operate less than 100 hours per calendar year for maintenance and testing purposes are not subject to the emission requirements of this rule.

# How does District Rule 4703 compare with federal and state rules and regulations?

## **Federal Regulations**

There are no EPA Control Techniques Guidelines requirements for this source category.

# A. Alternative Control Techniques (ACT)

District staff conducted a comprehensive evaluation of EPA ACT requirements. The following ACT has not been updated since Rule 4703 was approved as meeting RACT requirements through EPA's approval of the District's 2014 RACT SIP. During this approval, it was determined that this rule met or exceeded RACT. Therefore, further evaluation is not necessary at this time.

 Alternative Control Techniques Document—NOx Emissions from Stationary Gas Turbines (EPA-453/R-93-007 1993/01)

#### B. New Source Performance Standards

District staff conducted a comprehensive evaluation of EPA NSPS requirements. The following NSPSs have not been updated since Rule 4703 was approved as meeting RACT requirements through EPA's approval of the District's 2014 RACT SIP. During this approval, it was determined that this rule met or exceeded RACT. Therefore, further evaluation is not necessary at this time.

- 40 CFR 60 Subpart GG Standards of Performance for Stationary Gas Turbines (2009/03)
- 40 CFR 60 Subpart TTTT Standards of Performance for Greenhouse Gas Emissions for Electric Generating Units (2015/10)

# C. National Emission Standards for Hazardous Air Pollutants (NESHAPs) and Maximum Achievable Control Technologies (MACTs)

40 CFR 63 Subpart YYYY - NESHAP for Stationary Combustion Turbines (2020/03)

Subpart YYYY establishes national emission limitations and operating limitations for hazardous air pollutants (HAP) emissions from stationary combustion turbines located at major sources of HAP emissions, and requirements to demonstrate initial and continuous compliance with the emission and operating limitations.

This NESHAP does not regulate NOx emissions; therefore, comparison of these two rules is not required.

# State Regulations

There are no state regulations applicable to this source category.

# How does District Rule 4703 compare to rules in other air districts?

District staff compared emission limits, optional control requirements, and work practices in District Rule 4703 to comparable requirements in rules from the following nonattainment areas:

- Bay Area AQMD Regulation 9 Rule 9 (Amended December 6, 2006)
- Sacramento Metropolitan AQMD Rule 413 (Amended March 24, 2005)
- Ventura County APCD Rule 74.23 (Amended November 12, 2019)
- South Coast AQMD Rule 1134 (Amended April 5, 2019)

Based on a review of rule requirements implemented prior to EPA's approval of the 2014 RACT SIP, District staff found that Rule 4703 continues to implement RACT levels of control. For the more recently amended rules, District staff is providing an analysis to demonstrate that RACT continues to be met. This analysis is presented below.

## Ventura County APCD

VCAPCD Rule 74.23 (Stationary Gas Turbines)

	SJVAPCD Rule 4703	VCAPCD Rule 74.23
Applicability	Gas turbines ≥ 0.3 MW or a maximum heat input rating of 3 MMBtu/hr	Gas turbines ≥ 0.3 megawatt (MW) or greater

	SJVAPCD Rule 4703	VCAPCD Rule 74.23	
Exemptions	<ul> <li>Laboratory turbines used in research and testing for the advancement of gas turbine technology.</li> <li>Units limited by permit condition to be operated exclusively for firefighting and/or flood control.</li> <li>Emergency standby turbines limited by permit condition to operate less than 100 hours per calendar year for maintenance and testing purposes.</li> </ul>	<ul> <li>Laboratory units used in research and testing for the advancement of gas turbine technology.</li> <li>Units operated exclusively for firefighting and/or flood control.</li> <li>Units operated less than 200 hours per calendar year.</li> <li>Emergency standby units operating during either an emergency or maintenance operation. Maintenance operation is limited to 104 hours per calendar year.</li> </ul>	
Requirements	The operator of any stationary gas turbine shall not operate a unit in such a manner that results in NO <sub>X</sub> emissions, referenced at 15% O <sub>2</sub> , shall not exceed the following limits:	A person shall not operate a stationary gas turbine unless $NO_X$ emission concentrations, referenced at 15% $O_2$ , do not exceed the following limits. However, the rule also includes a provision for alternative means of producing equivalent emission reductions at the facility site or in the community for units where compliance with the below limits would exceed the established costeffectiveness thresholds of the district.	
		Rated < 3 MW	
	Gas Fuel - 9 ppm Liquid Fuel - 25 ppm	Current Limits Gas Fuel - 42 ppm Liquid Fuel - 65 ppm	
		January 1, 2024 Limits Natural Gas - 2.5 ppm All digester gas fired units - 9 ppm Liquid Fuel - 30 ppm	
	Units Rated ≥ 3 MW and < 10 MW		
	Pipeline Gas: Steady State Operation – 8 ppm Non-Steady State Operation – 12 ppm Liquid Fuel – 25 ppm  < 877 hr/yr: Gas Fuel - 9 ppm Liquid Fuel - 25 ppm	Current Limits <877 hr/yr: Gas Fuel- 42.0 ppm Liquid Fuel - 65 ppm ≥877 hr/year Gas Fuel- 42.0 ppm Liquid Fuel - 65 ppm	
	≥ 877 hr/year and not listed above: Gas Fuel - 5 ppm Liquid Fuel - 25 ppm	January 1, 2024 Limits  Pipeline Gas:  Liquid Fuel - 30 ppm  <877 hr/yr:  Natural Gas - 2.5 ppm  All digester gas fired units - 9 ppm  Liquid Fuel - 30 ppm  ≥877 hr/year  Natural Gas - 2.5 ppm  All digester gas fired units - 9 ppm  Liquid Fuel - 30 ppm  Liquid Fuel - 30 ppm	
	Units Rated ≥ 10 MW		
	Combined Cycle: Gas Fuel - 5 ppm (standard) Gas Fuel - 3 ppm (enhanced) Liquid Fuel - 25 ppm Simple Cycle and ≥ 877 hr/yr: Gas Fuel - 5 ppm (standard) Gas Fuel - 3 ppm (enhanced) Liquid Fuel - 25 ppm	Current Limits  < 877 hr/yr:  Gas Fuel- 42.0 ppm  Liquid Fuel - 65 ppm  ≥10.0 MW, no SCR  Gas Fuel- 15 ppm  Liquid Fuel - 42 ppm  ≥10.0 MW w/ SCR	

SJVAPCD Rule 4703	VCAPCD Rule 74.23
Simple Cycle and > 200 hr/yr and < 877 hr/yr: Gas Fuel - 5 ppm Liquid Fuel – 25 ppm  Simple Cycle and ≤ 200 hr/yr: Gas Fuel - 25 ppm Liquid Fuel – 42 ppm	Gas Fuel- 9 ppm Liquid Fuel - 25 ppm   January 1, 2024 Limits  ≥ 877 hr/yr:  Natural Gas - 2.5 ppm  All digester gas fired units - 9 ppm Liquid Fuel - 30 ppm  > 200 hr/yr and < 877 hr/yr:  Natural Gas - 2.5 ppm  All digester gas fired units - 9 ppm Liquid Fuel - 30 ppm  ≤ 200 hr/yr:  Gas Fuel - 25 ppm  All digester gas fired units - 9 ppm Liquid Fuel - 30 ppm  Liquid Fuel - 30 ppm

The rule was recently amended in November, 2019, to lower NOx emission limits, however, the limits would not take effect until January 1, 2024. Furthermore, VCAPCD's Rule 74.23 includes an alternative compliance option for facilities that exempts units from meeting the limits under certain conditions, including unfavorable cost-effectiveness. Given this exemption and limits that, if complied with, extend well beyond RACT, VCAPCD Rule 74.23 does not establish RACT levels.

# South Coast AQMD

 SCAQMD Rule 1134 (Emissions of Oxides of Nitrogen from Stationary Gas Turbines)

Turbines)				
	SJVAPCD Rule 4703	SCAQMD Rule 1134		
Applicability	Gas turbines rated ≥ 0.3 MW or with a maximum heat input rating of > 3 MMBtu/hr	Gas turbines rated ≥ 0.3 MW output or with a maximum heat input rating of > 3 MMBtu/hr and operated on gaseous and/or liquid fuel		
Exemptions	<ul> <li>Laboratory turbines used in research and testing for the advancement of gas turbine technology.</li> <li>Units limited by permit condition to be operated exclusively for firefighting and/or flood control.</li> <li>Emergency standby turbines limited by permit condition to operate less than 100 hours per calendar year for maintenance and testing purposes.</li> </ul>	<ul> <li>Laboratory turbines used in research and testing</li> <li>Gas turbines used exclusively for firefighting and/or flood control</li> <li>Emergency standby units used to provide electrical power, water pumping for flood control or firefighting, potable water pumping, or sewage pumping provided non-resettabl engine hour requirement and operate less than 200 hrs/yer.</li> <li>Stationary gas turbines: subject to Rule 1135 – Emissions of Oxides of Nitrogen from Electricity Generating Facilities; located at petroleum refineries, landfills, or publicly owned treatment works; or fueled by landfill gas.</li> <li>Combined cycle gas turbines installed prior to 4/5/2019 have conditional exemptions</li> <li>Low use installed prior to 4/15/2019 has specific exemptions and subject to NOx limits at 12 ppmv</li> </ul>

The requirements established in District Rule 4703 and SCAQMD Rule 1134 (as amended on August 8, 1997) have been previously approved by EPA as implementing, at minimum, a RACT level of stringency. When the new SCAQMD limits do take effect, the requirements of SCAQMD Rule 1134 for stationary gas turbines will go beyond RACT, and have not been widely adopted in SIP rules. Additionally, given the District's existing stringent limits, the cost-effectiveness associated with the installation of additional controls will be far in excess of RACT cost-effectiveness levels.

### Conclusion

District Rule 4703 meets or exceeds federal RACT requirements for this source category based upon evaluation of applicable federal regulations, state standards, and other air districts' rules.
